Thanks guys. Never do believe the ads as far as the gain claims. Just that someone sent me their webpage and I have never heard of them before. What even made me bat an eye at the site was the interesting way they claim that all other manufacturers antennas are only a 1/2 wave length loop while THEY make the only true full (1) wave length antenna.

6195. GREAT DX TONIGHT

The DX was great tonight. I made several contacts here in Derby, KS (just outside of Wichita). South Carolina, Mississippi, Alabama, Texas. "22" in the Carolinas was booming here in Kansas. Must have one of those big, big radios. Does anyone know if the DX is supposed to be that great tomorrow night?

"822" Rocketman in Derby, Kansas in the wheatfields.

I'm going to buy a new cb tranciever, but i don't know witch of the 2 I should take.

I know the Lincon, because some of my friends have got them, but I hear incredable things about the Magnum Delta Force too.

I want in the first place for the SSB and in the second place for the FM.

Whitch should I take, looking at preformance and power????

I'm working here with a Shakespear Fiberglass 5/8 wave antenna, and a Alan/CTE International K222 SWR/Power meter.
and at this moment a President George (1994 edition/first edition, black display with colour letters and numbers)
(With code) and a 3 to 5 Amp. power supply (this is going to be a 20 to 22 Amp. power supply)

6205. 27mhz FM

Newsgroup: rec.radio.cb
Date: 2000-06-17 00:00:00 UTC
From: As signed <evil_wevil@gogo.net.au>
Message-ID: <8ieoeu$938$1@merki.connect.com.au>
Source record: 39978

Greetings,

Used 27mhz FM mobile to mobile the other day with a second unit (Obviously).
The quality of reception over the AM and SSB mode was astounding.

Imagine a signal strength of 1 's' point with the clarity of S+9 AM signal,
so to speak. The AM sounded shit by comparison (A Latin term describing
"lousy").

The FM was great. And I'll use it when I can.

Darn wish the US had picked up an AM/SSB service to begin with.

Anyone else?

Regards, J.P (AUS)

> The problem is that you fail to realize that the -50 watts power is split
> into two sidebands.

How can you have negative power? -50 watts?

The "-50" is simply a DC voltage. He is showing that 0 volts
can be expressed as the sum of two voltage terms (or three or more).

OK. Let's say the signal is:
50 + (-25) + (-25)

I see zero volts. Do you still see 50 volts when these are
put together?

> Their frequency is shifted from the carrier by w2 up or
> down. How do you propose to add the powers in the time domain?

It can be done but it is complex (and, frankly, not all that useful).
That is why your Amateur Handbook does not give it to you.
The time averaged power reduces to nice expressions that most
people can deal with and, in general, it is all they ever need.

> If you imply that the total power of the composite signal goes to
> zero then, yes I agree to that.

It's not implied; it's explicit. And that "composite signal" is
what goes out your antenna connector.

> The problem is the carrier being amplitude modulated is not the
> a*cos(w1*t) term.

Sure it is.
Look at the equation again:
(A * (1 + (Bcos(w2t)))) * cos(w1t)

cos(w1t) is being multiplied by a function that varies from
0 to 2 and back to 0 (when A=1 and B=1 -- the 100% modulation case).
It is unequivocable.

> Instead the sideband carrier terms are amplitude
> modulated. They are a function of the central carrier w1, the
> modulating frequency w2 amd the power level of both.

Let's look at the form that shows the sideband terms:
Acos(w1t) + 1/2 ABcos(w1t+w2t) + 1/2 ABcos(w1t-w2t)

The sideband frequencies, cos(w1t+w2t) and cos(w1t-w2t), are
each multiplied by 1/2 * A * B -- ALL CONSTANTS!
How can you say that "the sideband carrier terms are amplitude
modulated"?

> *And, just like my FM multipath interference question (which nobody
> *answered by the way), if I stop at a red light and my FM radio

> *shows nothing but you say it is there. What's wrong with my
> *radio?
> **********8
>
> Well in the first place I did not realize that question was directed at
> me.

It wasn't. It was just an scenario described in another thread
that attempts to illustrate that the term "composite signal" means
the actual signal.

> But if you wish I will take a feable stab at an answer. Most
> multipath problems I have dealt with are of the variety where the
> second signal is delayed.
> But if somehow one signal takes two paths and arrive at the same time
> then in order to cancel ther would have to be some sort of phase shift
> in one of the paths. The two paths are there in order for the phase
> difference to cancel.

Exactly. There are two terms adding to create the resultant term,
the so-called "composite signal." At the right spot(s), the second
term is delayed by some odd multiple of 180 degrees. So you get
(with no FM modulation):
(A * cos(w1t)) + (B * cos(w1t + n180))
(n is an odd integer)
Using another trigonometric identity, cos(x + 180) = -cos(x), we
can rewrite the equation as:
(A * cos(w1t)) + (B * -cos(w1t))
When A and B are equal, the signals cancel out and you get nothing.

> Because your signal goes away does not necessarily mean ther is no
> power at the reciever end.

My 'S' meter says "zero." When I was five feet back, I had a
strong signal. Howard Stern was coming in loud and clear. He
was just introducing some lesbians and it was getting really
interesting. Now, I get nothing. If there is power there,
why can't I receive it?

: That composite signal is "the" signal that goes out your
: antenna connector.

Yes and no. Let's assume we have a carrier at frequency F, which is modulated by a audio sine wave of frequency f. There are then three signals going to the antenna - F, F-f and F+f. All three of these signals are independent of the others and are all sinusoidal.

The fact that the rf current and voltage is zero at times for the "composite" signal is immaterial and meaningless. If you looked at the carrier in the time domain (using a proper filter in the coax to get rid of the sidebands), you would see that it was still a sinusoid of frequency F and that modulation did not affect it in any way.

Such an examination is not practical with an audio signal, but you can just as easily modulate a carrier with an rf signal to get two sidebands that can be filtered out.

: if you get a direct hit then the radio gear will be the last of
: your worries....your gonna be so busy fighting fire that you
: won't even think about the radios....

If you have a proper lightning protection setup, then your house won't be hit - although the antenna might be. In any case, again with the proper setup, your rig will not be damages. The antenna and coax up to the side of the house might be slag, however.

It is not cheap, but such systems are installed all the time. The best examples are repeater systems for police and public service agencies, repeaters for pagers and cell phone towers. They all keep operating right through lightning strikes - although an occasional transmission might be lost.

news:394A99C3.7BC6F9F5@willinet.net...
: What's the difference between 50 and 75 ohm? is there a way to change
:that?

In the coax, no. A matching network is possible, if you felt it was
necessary.

: Like, a TV antenna really isn't anything but a bunch of metal rods welded
: together, so why won't it work with a CB? What makes it 75 ohm? Is it the
: metal used?

The antenna is 300 ohm, not 75 ohm. If you are feeding the antenna with
75 ohm coax, then there is a matching transformer at the antenna.

All I can say is this, if you guys don't think they need to be in the amps(100 ohm resistors) Then why is this one of the only ones that I have ever seen without them? Why don't you try it without them and see what happens. They are not used to tell you that your amp is blown, they are there for a purpose, all I did was add my 2 cents as I am now.

95GT aod-e,
If you just have to have a 'combination antenna, that one
is probably as good as any of them. That is not to say that
any of them are any good, they aren't. Even one of the short
'clip-on' antennas would probably perform better. But that's
up to you...
Good luck.
'Doc

Yes, I've made a few 27MHz contacts on FM, but seems that stations running FM are few and far between. I tried calling CQ FM on 27.555, listening on 27.455, and someone called me an idiot but wouldn't elaborate. Is 27.555 a SSB only calling freq? Is there an FM calling freq? I like FM because the interference to audio systems and telephones is almost nonexistant, since those devices cannot detect the small freq shift caused by FM modulation, but can detect the amplitude changes caused by AM modulation. In Europe, FM is the main mode, and it works much better than AM. No hetrodyning, quality is better, less interference to neighbors, etc. Don't know why FM would be illegal in U.S. since it would mean fewer neighbor complaints to the FCC.

Robert

Huh... Since when?
FM works as good as any mode for long distance talking on any frequency. FM also has an excellent advantage over AM and SSB... it's lack of sensitivity to much electrical noise. You see... most electrical noise in the world is amplitude modulated. That is the primary reason that almost all public service(police, fire, etc...) use FM. To get away from the noise!

How could the AM peak power be less than the dead carrier power??????
It can never be less! It could only be the same if you had zero
modulation...
Back to the drawing board Bill.

That is another advantage to FM... being able to "floorboard" the RF amplifier without getting any audio distortion. Unlike AM systems that will require "power headroom" when the modulation is added. That's why people that drive their amps too hard on AM sound fuzzy and distorted. They are attempting to exceed the maximum amplitude of the wave that the amp is capable of...

Professor wrote:
>
> Now let me get this straight... Elites claim to be class AB but are really
> class C(no bias)?

Correct. A simple diode bias circuit is there, but
it's purposely grounded out.

The reason why is that those amps use high-gain
transistors and no feedback. In other words, if
the bias circuit was active, those amps would be
so dirty and unstable that they wouldn't work in
any practical application (they would squeal, run
hot, and fail to unkey). Even with no bias they
have a hard time working in applications where
they are driven by an export or 10 meter rig.

Also, when you do activate the bias circuit you'll
find that their bias circuit design overbiases the
transistors--which only makes their already unstable
circuit that much more unstable.

I've written about this before. I'm surprised that
you (Griffey) never noted it. You know I'm a CB amp
God and that the amp tips I provide are golden nuggets
of practical and applicable wisdom that should be
stored on the hard drive of anyone who involves them-
selves with CB amps. What's the matter with you?

I guess that was the only part of the message that you read. I went on to qualify it and say that 10-meter FM is acceptable. I guess you've never tried FM on the lower HF bands. Probably not. You get problems like multi-path distortion, selective fading for two. Either of those can make an FM signal completely unreadable. That's one of the reasons that SSB and CW are so popular, they are narrow band and experience almost no selective fading or multi-path distortion. If you don't believe me just try to listen to a regular short wave station that uses AM when one sideband takes a different path from the other or the carrier. Selective fading can make even AM signals unreadable on the lower bands. The upper bands like 12 and 10 rarely experience severe selective fading because the difference between the upper and lower sidebands (or top and bottom of an FM signal) are insignificant when related to the frequency. It all comes down to percentage of difference in relationship to the carrier or center frequency. When that percentage of difference is large the selective fading is bad, if that difference is small then selective fading is insignificant.

Hi 'Doc,
That is what I have been reading, that using a radio antenna for the cb is not really a good thing. I did see something at Firestik, a "Match-MakerTM CB/AM/FM, CB Antenna Splitter" http://www.firestik.com/Catalog/AR-1A.htm which utilizes a/their cb antenna to bring reception to the radio and the cb. I guess replacing the oem radio antenna on a Mustang with a cb antenna would be an option, probably just look a little different. Is mounting a cb antenna in the oem location (right front fender) a good/bad idea? Are you familiar with one the AR-1A?

TIA.

If an SWR meter really read SWR you would not see the apparent changes in SWR whenever you changed line length. The reading would be constant regardless of length. I am going on vacation for the next 2 weeks but will do an experiment to verify whether or not impedaance of the source can effect an SWR reading. I think maybe it can. What I am going to do is place a tuner on my radio and run this into a dummy load and adjust the tunner for a 1:1 match to the 50 ohm load. Then place an SWR meter after the tuner and see if varying the tuner has an effect on this meter. IF there is an effect maybe I can go on and find out what the relationship is. Should not be too hard to do if you make up some dummy loads other than 50 ohms. Maybe a 75, 100, and a 150.

My vote goes for the DX-959. It has the following features not found on the
Grant:
Freq counter
Variable Talkback control
Switchable roger beep
Variable output power control
Larger meter
Automatic SWR reading w/no calibration
Modulation meter
It also seems to "peak up" better, has a spot for 2nd final, does
channels easy etc.....It also uses the new "696" board which seems to have
better receive & freq stability than the "export" boards.....Good Luck!

No... it will have no effect. It will however have an effect on the power transmission to the load.
That's why they have "S" parameters for various devices... to characterize the complex impedances of a device at various frequencies so a match can be made to a known load.

On FM only the stronger signal can be heard. There is no heterodyning with other stations.
This can be good for local talk but not good for DX cause you wont hear any of the less dominate stations like you do on channel 6 AM.

AM Example when a Big Station takes a breath his modulations amplitude is at a minimum while a smaller station could be running his mouth so his modulation amplitude is at a max. Giving the appearance that he is keying over the bigger station.

FM Example there is no min and max amplitude so the stronger station constantly dominates until he unkeys.

Let's take this concept one step farther...
If you have an amplifier feeding a 50 ohm line and finally terminated into an antenna where the SWR reads very low... that means you are getting the maximum power from your amp to your antenna... right?
Not necessarily! You see... if your amps output impedance is something other than 50 ohms... you will have a mismatch... even though your SWR meter reads very low! All the SWR meter tells you is if your antenna is matched to your coax... I'm afraid it says little about the potential maximum power you will really get from the amp. That's why getting a proper match from the amp to transmission line is imperative. Most amps out there have a lousy output match and therefor waste gobs of power by heating up the heatsink. If you have an amp that gets real hot after say 10 minutes of normal talking... and your SWR is very good... then your amp has a very poor output match.

Signal Engineering has changed hands twice since the early days of C.B. radio. I spoke with the new owner about 5 or 6 years ago, when looking for a 6 element beam. He sent me out alot of
literature about their line of antennas. He even gave me a follow up call about two months later, to
see if I had any more questions! I never did buy one, even though my tech said that you can't beat a
Cubical Quad antenna. I didn't buy one because there are enough used antennas out there of other
brands for a lot less money then new. I bought a Lazer 400 for $100.00 used. If I was going to spend
money on a new antenna though, I would consider them as I think that it was nice for a company to
take the time to see that all my questions were answered...

in theory thats how its supposed to work but its been my experience with the export type rigs they rarely show a true capture effect like you say and there also often still interfered with by power line noise where a dedicated FM radio would not be. FM is as good as a mode to dx with as any other. maybe not so good for the super bowl dx'ing but its always nice to have over the ocean contacts on good clean fm.

Message-ID: <_1N25.2260$Ai6.17345@typhoon.kc.rr.com>
Source record: 40069

I have bought a used sweet 16 and the person who had owned it took the remote turn-on and fan jacks as well as the fuse holder out of the amp. I bought a DX fan kit and remote set-up, and would like to hook it up to the amp. I did go buy a couple of remote female phone jacks but I am not sure where to wire them up to...I know that the remote fans are operated by a thermo switch on a factory stock amp...that would be ok but on full time when the amp is on would not be a bad thing either....this amp is only going to be a back-up for when I really want to get out and talk to DX. Also the radio in antenna out is not marked. Can anyone help me out here!

Thanks alot

It is a common misconception that FM is local ONLY. Being a UK CB'er I can vouch for our system. I have been able to test FM against both AM and SSB and of course SSB whips it but the distance that AM and FM is nearly identical. FM has better quality and is quieter. Many of the old import rigs that we got in the eighties where standard AM sets with FM added and often badly done. I am not saying that's been done on yours but it has given FM a bad reputation.
Cheers

Prozac,
I can not say if I have since I don't know your 28. also if your not on the bowl or the tracks I know I have not heard it. Email me and let me know your 28. I have had conditions in the east cost from the love country to the big apple so if your out there and running 10-8 with that 32 I should be able to hear you. If your not then you might want to take up Bowling.

*hamm4fun@aol.com (Hamm4fun) wrote:
*
*> There is nothing wrong with triming the coax to get a good impedance
*> match as long as you know what you are doing.
*
*Except that it is a pain in the butt and in real world scenarios
*(i.e. where coax losses are non-zero), even at its best, it does
*not perform as well as a matched system where the SWR is lower.
*
*Longer lengths of coax contribute to more loss.
*A higher SWR (even in a matched system) contributes to more loss.
*
*If you "know what you are doing," you can reduce your SWR and
*minimize your coax length for the optimal, highest performing
*solution. Why make your goal a compromised solution? ...especially
*if you "know what you are doing?"
*
*> This is especially true when you are using a solidstate amp when you
*> cannot count on the input or output impedance to be the magic 50.
*
*You would be better off matching your output to the 50 ohm input
*of a low SWR line. Then, you don't get the extra losses due to
*SWR and you could cut your coax shorter for even lower losses.
*
*Cutting the coax to specific lengths is a joke of a solution.
*The first problem is that, if your transmitter impedance is not 50 ohms,
*you probably don't know what it is.
*Secondly, even if you did know its impedance, modifying the coax
*length only provides certain impedances. It may get you closer to a
*match but it almost certainly will not provide that conjugate impedance
*you need for a total match; you will still need an antenna matcher or
*output tuning to get all the way to a match. If you must do this, you
*may as well just tune your output for 50 ohms.
****

How do you get a conjugate match into a transmission line of fixed
characteristic impednace? I have an antenna tuned to 50 Ohms impednace with 50
Ohm coax. Now to get the maximum power transfer from the transmitter to the
coax, do I need to provide a conjugate match to the coax from the transmitter?

james

****
*> Like I said though SWR meters don't measure SWR they are much
*> better at indicating impedance match.
*
*You did say this before and I still don't know what it means.
*
*> One thing I have not figured yet,
*> Does the output impedance of a transmitter effect SWR reading?
*
*No.
*
*> I know it does not effect the actual SWR. Another way to pose the
*> question would be," when you use an SWR bridge to indicate impedance
*> match is the indicated match between load and source or between load
*> and 50 ohms.
*
*SWR meters are generally constructed for one characeristic impedance.
*They must do this by virtue of the way they work. They sample both
*voltage and current to provide a directional reading. For a forward
*only reading, the sampled reverse voltage and reverse current must
*cancel each other out. In order for these signals to cancel out of the
*reading, there must be a fixed relationship between the two (the
*impedance). At any other characteristic impeance, the ratios between
*these two parameters would be different and the cancelling mechanism
*would not work completely.

6291. Re: 27mhz FM

Newsgroup: rec.radio.cb
Date: 2000-06-17 00:00:00 UTC
From: "Kevin Muenzler, WB5RUE" <wb5rue@stic.net>
Message-ID: <8igigf$emb@nnrp2.farm.idt.net>
Source record: 40085

FM on CB has a couple of disadvantages (other than being illegal in the US)
1. FM is extremely easy to jam. I can jam your FM signal and make it completely unreadable with a relatively weak carrier or SSB signal.
2. FM is almost useless for skip on HF. Yes, if conditions are very quiet and stable you can do it. But conditions are rarely quiet and stable on CB. If things are quiet there is no skip. FM skip on 10-meters is pretty good because 10-meter (and 11-meter) skip propagation is usually stable. If CB wasn't so crowded it would be great.

Cheap crystal mixed AM only CB radio, sold in the marine market in the seventies. Modifications are possible but not worth bothering with. It will require crystals and switching to expand the coverage.

1) From what I have heard, any Harada products that make it to North America are of suspect quality to begin with.

2) AM/FM/CB sounds great in theory but in practice is a poor choice.

3) The first decision you make should be to prioritize broadcast radio or CB, pick one and go shopping for antennae based on that. See what's out there besides Harada products.

Thank you for responding. Mostly it is FM or CD when I'm not traveling.
When I travel it is usually CD with the cb on to talk with the truckers and
to pick up on traffic info that they discuss. The area that I'm located in,
there doesn't seem to be any cb shops to get any info from. Do you have any
brand name recommendations for the type of antenna I'm looking for?

TIA, again.

I agree.

> You
> should sound loud, not wide and fuzzy.

Again, I agree. There is a threshold between loud and
distorted. It boils down to peak-to-carrier ratio.
I've written articles about that subject more times
than I'd like to remember. In a nutshell, if the
peak power is less than double the dead carrier power,
you'll sound pinched and choked. Prevent that, and,
run an amp that's stable and accurate, and you'll sound
good no matter what.

6310. Re: Base Antenna Help

Newsgroup: rec.radio.cb
Date: 2000-06-18 00:00:00 UTC
From: MC 10kW Jesus <qsl27@hotmail.com>
Message-ID: <394C2E2C.A25B8B62@hotmail.com>
Source record: 40033

I was making a statement that placing the antenna up that high should reduce the possibility of interference - as opposed to running it on a pie plate in your back yard. TVI is caused by spurious emissions of twice the fundamental frequency. The biggest problem I've come across is RFI. This is the fundamental being demodulated by electronic equipment due to the strength of the field. The higher you place the antenna, the less you are likely to cause RFI - by virtue of the fact that your antenna's pattern is further away from other electronic equipment.

MC

> How do you get a conjugate match into a transmission line of fixed
> characteristic impednace?

Easy. If the termination (antenna) is not 50 ohms, the impedance
seen at the input of the transmission line will not be 50 ohms.
To transfer full power into this antenna/coax combination, you will
need a conjugate match. This most common way to do this is with
an antenna tuner. If the coax input impedance is R+jX, you need
to make the tuner output impedance R-jX to achieve a conjugate match.

> I have an antenna tuned to 50 Ohms impednace with 50 Ohm coax.
> Now to get the maximum power transfer from the transmitter to
> the coax, do I need to provide a conjugate match to the coax from
> the transmitter?

Yes, but this generally requires little or no work. For a conjugate
match at 50 ohms, you need an output impedance at 50 ohms (conjugate
of 50+j0 is 50-j0). If your transmitter output impedance is 50 ohms,
you are already done. If it isn't, all you have to do is tune it
into a 50 ohm dummy load.

Bill Nelson (billn@peak.org)

Bill:
I want to share electrical service with you. We can 100%
modulate the 60 Hz, 220V service with a 1 Hz square wave.
Then, we will use a relay so that I tap off the power when
that "confabulated" waveform is present as seen on a scope.
On the low side, when no waveform is seen, the relay will
switch the available power to you.

Since we are each accessing the output half of the time and
you insist that the power is there during your half, I insist
that you pay 1/2 of the electric bill. It is fair, right?
Maybe we can a discount by combining our buying power.
I'm in. How about you?

Hamm4fun <hamm4fun@aol.com> wrote:
: If an SWR meter really read SWR you would not see the apparent changes in SWR
: whenever you changed line length. The reading would be constant regardless of
: length. I am going on vacation for the next 2 weeks but will do an experiment
: to verify whether or not impedaance of the source can effect an SWR reading. I
: think maybe it can. What I am going to do is place a tuner on my radio and run
: this into a dummy load and adjust the tunner for a 1:1 match to the 50 ohm
: load. Then place an SWR meter after the tuner and see if varying the tuner has
: an effect on this meter. IF there is an effect maybe I can go on and find out
: what the relationship is. Should not be too hard to do if you make up some
: dummy loads other than 50 ohms. Maybe a 75, 100, and a 150.

There is an easier way. Place an SWR meter at the load. Now vary the length
of coax feeding the load. If the coax can affect SWR, then you will see the
change in the meter connected at the load.

But make sure that there are no currents on the outside of the coax that
can affect the meter readings. It may be more difficult to eliminate these
currents than you might think.

: I'm in. How about you?

I repeat - forget this single cycle stuff. It is meaningless
confabulation.

Your example does not fit the carrier/modulation relationship
that exists in a transmitted signal.

Modulate that 60 Hz signal with a 1 Hz wave (it does not matter
what the waveform is, as long as it can be filtered). This is NOT
true for a square wave, which has frequency components from DC
to light frequencies (although the higher harmonics quickly become
negligible). Assume a sinusoid for simplicity.

If you looked at the signal on a spectrum analyzer, you would see
three signals. There would be the 60 Hz signal, a 59 Hz signal and
a 61 Hz signal.

Pretend that we have a selective enough set of filters so that we
can pass the 60 Hz signal on to you - and pass me the 59 and 61 Hz
signals.

I will happily pay for the power I consume from that 1 Hz signal
and you should happily pay for the power you consume from the 60 Hz
signal. No, we shouldn't split the bill. As the 1 Hz signal is
modulating the 60 Hz signal, the sidebands only contain only half
the power of the 60 Hz signal.

To quote from the Radio Amateur's Handbook "The amplitude of the
modulation envelope varies from instant to instant in the same way
as the complex audio-frequency signal causing the modulation. Even

in this case the CARRIER (emphasis is in the text) amplitude is
constant if the amplifier is properly modulated.

Also: "The extra power that is contained in a modulated signal goes
entirely into the sidebands, half in the upper sideband and half in
the lower."

And: "Supplying this additional power for the sidebands is the object
of all of the various systems devised for amplitude modulation".

Electronics texts on modulation systems all state exactly the same thing.
If they were not buried in a box somewhere, I could dig out half a dozen
of them to provide quotations.

If you cannot understand what the above statements state it is this:
The carrier is unaffected by the modulation, as long as the amplifier
is properly modulated (the power supply can provide enough power for
both the carrier and modulation etc).

Interesting... that amp sounds like a "real piece of work"... have never seen one. Maybe it's just as well.

Sorry if you took my response personally. It was not intended as such...
However, I don't think anyone could have taken that statement ("FM is almost
useless for skip on HF.") out of context.

What you say about FM is true but remember that AM/SSB have significant
problems as well... mainly noise. This hampers numerous local and long
distance contacts on those modes!

I like the features that Galaxy 99v has.
I bought one in late December from
Export R US It took 6 weeks to get
here... had it 4 days and the SSB
crapped out. So I sent it back for
repairs to galaxy and to Export R US for
remod. I bought another (wanted a pair
for base and mobile) from Left Coast
Radio. It was sent buy courier and came
faster. But the radio is not tuned as
promised. It emits 25% harmonics and
splatters like hell. The frequency
switch does not work right... only the
off position!!!???

I don't know if it is the radio or if
these exporters don't know how to tune a
radio.

BTW I have not seen the warranty radio
from Export R US yet but they have had
my money since Dec 5th!!!!!

I am getting a bit pissed off and
wondering if Galaxy is all that good!!!!

Hello;
Have the following for sale:
Siltronix 1011D Comanche 10/11 meters transceiver, with the Power Meter PM-15 and the VFO Model 90. Everything powers up and lights up, all tubes are good. Has been sitting in the closet, a little dusty. But is in very good looking condition. Face plate a 10. Only a couple of minor nicks on cabinet edges. No longer have a mic. or manual. Asking 175.00 plus shipping.

Bill

6347. ASTEC 62.5 AMP DC Power Supply

Newsgroup: rec.radio.cb
Date: 2000-06-18 00:00:00 UTC
From: Buying <trout1000@squonk.net>
Message-ID: <07rpkssqf5nm1umvbsllb5r2bbutsd7v76@4ax.com>
Source record: 40120

These are well made power supplies from the
best power supply company in the world.

I'm selling ASTEC:
VS3-K0-K2-K3-00
Single Phase 85-264 VAC / 47-440Hz Input
Three slots for output:
Slot one 2v @ 150amps
Slot two 5v @ 150amps
Slot three 12v @ 62.5 amps

Detailed Specifications On Power Supply:
http://www.astec.com/products/1150.astec.pdf
(Must have Adobe Acrobat installed to view)

Page 3 of 6 shows chart to determine all watt
and amperage outputs as well as the number
of slots for each unit.

This page has other models for sale:
http://www.newark.com/
Search for "manufacturer" part number and enter "VS3"
for other models then use the PDF (Adobe) specification
chart to compare output watts / amps.

One example is a VS3-C6-C6-20
which is VS3 or 5x8x11 case
Slot one is "C6" which is 28v @ 32.1amps
Slot two is "C6" which is 28v @ 32.1amps
The unit on that page is about $2,000

One other model:
VS3-D2-C2-20 is:
5x8x11 case
Slot one: 2v @ 240amps
Slot two: 2v @ 180amps
Price: $2,129

Selling these for $200 UPS "Shipped".
No lower on the price

Inquires via email only. Do not post to the newsgroup.

Thank you

OK, call me vain, but I'd rather put furry dice in my car than a chrome radio.

I'm looking for a CB radio with (preferably) a black fron panel (anything but chrome). It should also be the same size as a 'regular' car radio (so that it fits into the spare slot I already have in my car.

I'm sure I saw a Cobra CB that met this criteria, at a truck stop in New jersey, but I didn't make a note of the model and I've not been able to track it down (yet) on the web. Any help would be appreciated.

Peter

6357. Number assignments

Newsgroup: rec.radio.cb
Date: 2000-06-18 00:00:00 UTC
From: Daniel Friedrichs <dan@willinet.net>
Message-ID: <394CDCB3.65D10678@willinet.net>
Source record: 40130

Hello,
I saw some people on this board refering to themselves by a number
(615, 817, etc.). What does that mean? Can someone give me an
explanation about those?

Thanks,

--

Dan Friedrichs

>They had better be good for that price...

????

It is brand new in the box.

62.5amp / 12v
150amp / 5v
150amp / 2v

Are you joking on the price ?
It's a gift. Look at the specs and selling
price for these units.

Source record: 40134

Damn John! Sorry ya' had all those problems with the Galaxy. Like some folks are Chevy lovers and others are Ford, some love Galaxies, others hate them. Sounds like an incompetent tech did the work or the radios are faulty. Bad batches have been known to appear. I've had the 77 (don't like the meters on the 88 and 99, plus it is easy for the wife to operate) for 2 years now trouble free. I bought it locally, had a lil' swing put in and its exceeded my expectations. Some folks like them, some hate them. It is by far my favorite mobile radio. Good luck with it.

Daniel...

Some of those are numbers that we have made up..Like mine is 629 Kansas City Mobile..then some groups have numbers they assign to you..sometimes free sometimes not..Like I belong to the RCI (unofficial Ranger Radio group) and they assigned me 2 RCI 1257..I use my numnbers only on SSB operation..and my CB "handle" Jetstar on the AM side....however there are no so called "rules" here..and alot of users use numbers on the AM as well...(mostly for shooting skip) Talking long didtance..

Have a great one and enjoy your radio!!!

Ron

629 Kansas City Mobile
2 RCI 1257

Pace wasn't the greatest but was OK in it's time. I didn't like them then, but I should of bought a Midland in '77 instead of a Horizon 29 ! That's how to rate best/ worst CB's--in it's time (year, decade). It probably isn't right to rate a early 70's junky CB to any CB in the 80's or 90's. I need to think more on this question--WHICH is THE WORST CB ever made in ALL time, or the worst one in each decade from the 60's on up? Or is the worst one not made yet? Were there bad CB's made in '58 or 59? I doubt it. But everyone will have to agree that ANY CB made in Japan is better than any made in China! There was probably worse makes then & since then. NOW the worst ones are ANY CB made in red communist mainland jack booted thug pinko CHINA !
Dave!!!!!!!!!

I is not into amps like some of you BIG time power people, but the absolute WORST verified amp I ever saw was a blue one callled a "DOMINATOR." Probably made in the 'hood in Columbus, Ohio (I have heard), this rare piece of trash had NO seperate grounds--just one for the case & the (neg.) wire. Was there anything worse than this?
Dave!!!!!!

Killrwatt wrote in message <39348df9$0$76060$4bb17d6e@news.dwave.net>...
my worst amplifier was my first, a homebrew 4 6JG6 base amp, ALL you SS out there get this!!! I was 12 years old and an elderly Extra class ham Custom built it for me!! LOL, he even knew i was going to run it on 11 meters!!! Man that was one dirty Amp!! knocked out tv sets for blocks!

My Dirtiest Amp though without question was a D&A Phantom Triple power 12 tuber! Went over to my Girlfriends house 8 miles away and she proceeded to tell me how she heard me talking to Bermuda... Mind you this is in a rural area where the TV stations signal was pretty light.... But still... That thing sure put some RF in the air!! I was 15 at the time and living at home, my mother had about 100 feet of that metal core clear plastic coated clothes line stretched between some trees, it was getting dark, I had the old Phantom just cooking!! looked out the window and that clothes line was Cherry red!! everytime i would key the mike it would turn red hot in under 10 seconds! Next day she told me lightning must of hit her clothesline!!

"Fameous" big rip out of your pocket dollars going bye buy when you buy ANY wilson antenna. There ARE lower cost alternatives, you know. But then you all would have to get off your wilson "drugs" that you are on and KNOW the truth, which is, the LONGER it is, the better it is. The HIGHER up the coil, the better it will work. Period. Gain figures? Which LIAR made these up? The gain figures are based on an antenna companys ability to GAIN $$$$$ out of your pocket!!!! Just stick with the 2 main things you need to look for, and you WILL be richer so you won't have to be a nation stooge on "Who wants to be a millionair head" because you sent all your cash to the biggest liar gain antenna company!!!!!!
Dave!!!!!!!!!!!!!!!!!!!!!!!!

I have 1- 108" steel whip left, of which I may make more when out of them.
If interested, e mail me tomorrow.
Dave

Dave Musgrave wrote in message ...
I have a question, maybe a stupid one...

Im going to put a 102" Steel Whip on my Jeep Wrangler... properly done this will get the best transmit and recieve possible right?

1. Is one 102" Steel Whip better than another? Are there differences in material quality etc. or should I just get whatever I can find. If there is a "best" choice let me know you opinion on that.

2. What potential problems should I look out for when I install this thing? What do I need to know to do the job right? Any suggestions are appreciated!

Thanks in advance,
Dave

NO, do NOT get ANY cobras. Made in China trash NOW. Get the Uniden PC-68
or Pro-510.
Dave

Rocketman wrote in message <3937A4AF.27A6D82A@swbell.net>...
Stick with a Cobra or Uniden, but don't get the soundtracker. A Wilson 500
magnetic mount is a great little antenna. I would go with Cobra 25 LTD
myself. I like the Unidens, but I had a compact Uniden and they don't have
enough filters. Traveling long distance I might even spend a little extra
money and get the Cobra 25 LTD with the weather bands. I have ran into some
storms myself traveling and the weather bands are nice to have, especially
late at night when nobody is talking on the CB. Good luck.

What's distressing is how stupid you are.
(See below.)

> However... now understanding it... I disagree with it.
> I have a 2W carrier swinging to 350W peak and I have not experienced the
> phenomenon you speak of with this choking... or whatever!

You still don't understand. Re-read it one
more time. Using your example, if the carrier
is 2 watts and the peak is *LESS* than *DOUBLE*
the carrier (4 watts), you'll sound weak,
choked, muffled, pinched--whatever term you
want to use to describe the sound of an AM
signal where there's not enough headroom for
the positive modulation swings (excessive
negative carrier shift).

As for keying at 2 and swinging to 350, if
you weren't manipulating the carrier so that
it'll increase when modulation is applied,
you'd sound lousy too. There is a useful
range of peak to carrier power ratios: 2:1
to 6:1. Outside of that range the excess
distortion outweighs any benefit.

You try to pass yourself off as someone who
can design amplifiers--but it takes 3 tries
for you to understand a simple post about a
basic concept. Carrier shift and its conse-
quences should be something you fully under-
stand.

It's you who should go back to the drawing
board.

> P.S. Don't get so hostile... we all make mistakes. You seem to make plenty!

Yea-right... Nice try.

WW_725,
The type/number of the transistor makes absolutely no
difference, the output power does. An amplifier only 'sees'
the power input, it has no idea what produces it.
'Doc

They get my (and probably Dennis #12's) vote
for worst legitimate (legitimate meaning
using push-pull pairs of 211-07 and 211-11
case devices instead of TO-220 case devices
like the "Mosquito") solid-state amp line.

If you or anyone else that reads this ever
has to try to make one work in an application
where it's just too unstable in stock form,
the usual stability enhancing mods apply:

1. Lose the squirelly SRF devices. Low to
moderage gain (DC Beta of 20-40) Motorola
devices work best in those amps if stability
and spectral purity is what you're after.

2. Add boatloads of negative feedback. .1 uF
25 volt disc caps and 33 ohm 2 watt flameproof
resistors work well. You could even go lower
on the resistor value (lower resistor values
increase the level of feedback) by paralleling
pairs of resistors.

3. Be careful when activating the bias circuit.
If the amp is going to be used in an AM or AM/FM
only application, leave the bias circuit alone.
If the amp is going to be used on SSB, activate
the bias circuit by lifting the shorting bars
on the input transformers and removing any solder
bridges on the bottom of the board. Then, remove
the existing bias circuit power resistor and
replace it with a higher value that sets the
operating class at B when the transistors are
at room temperature.

I recently performed this procedure on a Boomer
Deluxe 400 and it turned out better than expected.
I'll use it as a practical example:

It uses four SD1446 devices rather than SRFs,
so I left them alone.

I added feedback loops as described above from each transistor's collector to base. I also made sure the head of each existing collector to ground capacitor was on top of each transistor cap. The leads on those capacitors are purposely left long just for that reason. Having the capacitor head on top of the transistor cap (aka pill) seems to increase the stability of those units.

I activated the bias circuit as described above. There was one solder bridge on the bottom of the board that had to be removed. Of course the board has to be completely removed to get at the bottom. Removing the board, hunting down and removing the solder bridge, cleaning up the contaminated heatsink compound, applying fresh heatsink compound, and reinstalling the board adds a half-hour to the job--so be patient or leave the bias circuit alone if the amp isn't going to be used on SSB. The stock bias resistor was a 35 ohm, 10 watt wirewound type. I replaced it with a 50 ohm unit.

The result was an amp that's just as stable as a Blue Face 450 (which is more stable than a Texas Star 400 or 500) and puts out just as much power as it did in stock shape (400 to 500 peak watts under normal drive and voltage conditions). The SSB audio is undistorted at any drive level from just above zero to well into the gain compressed region. The spectral purity is good for an amp that has no output filtering. The spurious emissions are all at least 25 dB below the fundamental when the amp is in its linear region.

So, all-in-all, even though I feel they are the worst design (of course I haven't seen one of Griffey's yet), they are cost effective and they have good points (good board quality, good chassis design, and strong TX relay) and the potential to be decent daily-use amps when modified for increased stability by competent techs.

Wait a second. While modulating with a square wave produces many
sidebands, a spectrum analyzer will still show you that most of the
power is still at the center frequency. There is no need to use
a sinusoid. A sinusoid is no less confabulated than my square
wave.

I'm not talking about sidebands. I'm talking about the signal in
the time domain. I want the time when a scope shows a signal.
I'm offering you the time when the scope shows no signal. You
claim that there is power there. I'll tell you what. You only
have to pay 40% of the bill. I'm cutting you a deal to show how
generous I am.

OK. So what's the holdup? Are you going to buy your half of
the line voltage? The Radio Amateur's Handbook even says that the
60 Hz is there. Let's call the electric company and get hooked up.

6386. Re: 2950DX or 2950E

Newsgroup: rec.radio.cb

Source record: 40159

I've never had either one on my bench, so all I can give you is
second hand info.

A distributor/tech who's fairly local to me and that I correspond
with over the phone occassionally said that he converted a 2950DX
and that it went from 24 to 32 MHz. He also said that it didn't
tune up to quite the degree of peak power that the older ones did
and that the addition of surface mount technology will make it
harder to work on. I asked if he had tested it for frequency
stability (tendency to drift) or overall receiver performance and
he said no.

I first noted the introduction of the DX model in the current AES
catalog where they talk about the improved receiver (FETs in the
front end rather than bipolars), green backlight and surface mount
technology. The price was good too ($250). I'm half tempted to
get one myself just to see how the receiver stacks up.

As for the E model, I've heard nothing about it at all.

I kind of go along with this logic too.

I ran 2950s from the time they first came out ('88) until last year
when I bought a used Kenwood TS430 for $285 on E-Bay. The Kenwood
is the equivalent of a 2970 on transmit (the last TX amp stage is
a push-pull linear amp stage consisting of a pair of Toshiba 2290s)
but is cleaner and better protected (SWR and thermal protection and
thermally switched fan over heasink cooling). As for the receiver,
there's no comparison as to which one is more pleasant to listen to.

I say stick with the 2290s. The reason why gets pretty technical,
but it comes down to how the device responds when running with no
bias at the low "knee" of its transfer characteristic. When used
as a "modulator" the transistors are run that way, and the 2290s
seems to perform best under those conditions. They are also a
heavier, higher power device then the 1446.

Ok guys... I got my whip, my ball mount base, and my heavy duty spring from Radio Shack. They even threw in a free catalog.

Now comes the question. WHERE on my rear bumper do I mount this thing. I know on the passenger side... but if you are familiar with the Jeep Wrangler, exactly where? Inside the "loop," outside the "loop," on the outside of the "loop" itself... etc.

What is the best bet here?

Thanks,
Dave

I have to agree with Bill, Stay with the 2290's. I Really like the 1446's,
but you will not see enough difference between the two to matter and the
2290's are not as "fragile" as the 1446.

6393. Re: Best Place To Mount This Thing

Newsgroup: rec.radio.cb
Date: 2000-06-18 00:00:00 UTC
From: Dave Musgrave <musgrave@twcny.rr.com>
Message-ID: <ZBa35.13355$rc.120607@typhoon.nyroc.rr.com>
Source record: 40166

It is my understanding that mounting on the passenger side gives the best "radiation pattern" for on road driving. I may be wrong there... but that is what Ive heard.
Then bumper is just the stock Wrangler bumper... the "bar" type bumper with the two big "loops" on each side.

```
_________________
-----------------------
U OOOOOO U
OOOOOO
```

In the diagram... the "-" line is the bumper
the "O" makes up the spare tire
the "U" are the loops on the bumper

Hopefully this little diagram comes out right. This is kinda what it looks like from the top. Just the standard Wrangler bumper.

PS
The whip will come off and a shorter fiberglass whip will go on for off-road use, thanks to suggstions from the previous whip on a Wrangler thread!

Thanks,
Dave

Get or make a direction finding antenna. Locate them and write down their addresses and give them out OR break in, hold them down, and cut the flap of skin that separates their nostrils (this is not recommended for obvious reasons).

Take a bird 43p, a 5 pill box into an 8 pill box, put about a 10 watt carrier into the five pill going into the 8 pill, look at the bird 43p, deadkey the radio for a second on 19 and then say " how about a radio check" you know like gunsmoke does, while you are doing this notice what the bird peak reading meter is doing, swinging down when you modulate, now this is assuming that you have enough voltage supply to keep the proper voltage. And just to make it easy, you could use Dave Mades for the amps, I don't suggest this but you said "explain" now before you tell me it cannot be done, try it yourself. and also notice that the truck drivers said "its ah workin ah radio check".

at this point the antenna is already going to be fairly directional, the location on the bumper isn't that important... try to keep it (the vertical portion of the antenna) as far away from other metal as possible. If you mount it on the left side it will radiate strongest to the front left, opposite side will yeild opposite results.....

good luck!

SICK Doc:

"Fear God, and Keep his Commandments, for this is the whole DUTY of
Man."
(last 2 verses of Ecclesiasties).
(you have not been doing that by your post.) God will
judge your mocking spirit.

The only cloth that you will ever get from me is a black one that
I will put over your Red Chinese Cobra 29 when it dies soon, for all CB's
are NOT created with the same quality in communist countries! What do I
sell? CB's and most everything related. My customers are great people, NOT
like yourself. More below double spaced is my answers to your rantings!
Dave

w5lz wrote in message <393ED2EC.7F75C47C@oio.net>...

Dave or Debby,
Like most 'crusaders', your opinions are not devinely
inspired. More like they're inspired by some misconcieved
idea of personal gain, not necessarily money, a sense of
accomplishment maybe(?), who knows. And, like most 'crusaders'
your point is overstated to the point of being rediculous,

I believe YOU are more "boring" than I could ever be! Are you
trying to relate me to the "Crusades?" They were catholic and I am NOT. Is
it an overstatement to tell people WHY they shouldn't buy RED Chineswe CB's?
Maybe you want to support communism. I don't,

borring, and incorrect. Sooner or later you'll get around

OH--my point is incorrect? Chinese CB's are better? You must be
on some heavy DRUGS, sunny! Am I incorrect to advise people not to buy this
trash, since I only have been a CB Tech/ Shop for almost 21 years? You must
not like quality to say that I am incorrect to inform people as to the TRUTH
of not supporting these boat anchor manufacturers!

to telling us what your trying to sell. Why don't you just
'cut' out all the rhetoric and tell us what you want us to

I want you to believe that Jesus Christ is the truth, the way &
the life. He is GOD in the flesh. I want you to repent of your SINS and DO
the 10 Commandments! The so called "rhetoric" is to teach you to NOT
support GOD's and our enemies, the communists. Is this a problem because
you may be one?

to believe, how you want us to behave, what we should or should not buy, where to buy it, what to pay for it with, and what

I want to to behave pursuant to Christian Law. Can you think of a reason WHY I should have you buy CB JUNK made in China? Why buy it from the corporation, instead of the "little man?" What to pay for it with? Constitutional money, of course! Art. 1 Sec. 10 U.S. Constiutution. Why would I want to use anything else? !!!

we should do with it after we get it?

Do what you do best--ask for radio checks after you get it! Say "breaker-breaker--is this radio getting out? !!!!

Should we call you "Brother Dave" and "Sister Debby"? Do

You are our Brothers and Sisters IF we have the same Father. There is 2 Fathers. Father God & your father is the other one. There is NO "brotherhood of man" unless it is under Satan!

you offer 'prayer' cloths? If we put our hands on the monitor while reading your posts, will we 'feel' the goodness and enlightenment come'n through? Will your 'preaching' and a quarter buy a cup of coffee? You bet! Puke a buzzard!
'Doc

God may have you puke buzzards after a post like that. Quit relating me to false State church profits that you may have a liking to. I am a NON-red china selling CB shop that does NOT RIP OFF my customers like most of your bozo CB shops do for the big bucks. And because I don't do this, you can't relate THIS preacher to the ritzy Babylonian harlot daughters that you see on your devilvision. You can have a life, and one more abundant IF you repent!
Dave

sorry i mistyped the radiationt pattern rear left will uield strongest on front right, and vice-versa....

The locations sounds ok, however remember to put it somewhere that it cannot get knocked off from a stump or something! also, make sure whatever you mount it to is well grounded, some of those bumpers are rubber mounted...

From: Dave or Debby <truth@planetc.com>
Message-ID: <394d52a1@news.planetc.com>
Source record: 40183

They are only the same IF they are made in the same country (Phillipines).
If one is made in China, it IS INFERIOR !!!
Dave!!!!

Miles Davis wrote in message <8hkuc9ept1@nnrp02.primenet.com>...
Hey Bill,

It is clear the PC76 and the Cobra 29 are the same radio. I have a Cobra 29
LTD Classic and I need a schematic for it. Any ideas on where I could find
one?

This is CB radio.....No crying allowed!

6411. Rat Shack going to da MOON !

Newsgroup: rec.radio.cb
Date: 2000-06-18 00:00:00 UTC
From: Dave or Debby <truth@planetc.com>
Message-ID: <394d543f@news.planetc.com>
Source record: 40184

I saw in a Wall St. Journal article last week that the Ratty shack will have it's logo on a lunar roving vehicle that will waste time up there (allegedly) looking for water! It talked about it as the least cluttered advertising place. I SAY: IF you got questions, Rat Shack does not have the answers! Instead go to your Mom & Pop (Little Man) CB shop for ALL your questions answered by people that definately know more than what the Rat's teach!

How do I know this? I am one of the "Little Man" CB shops, and I have had the sense to stay away from the Rats since '72 ! Remember then how you can tell if someone is on a RS CB base? All their mikes sounded the same (different from other CB's. I could tell if someone keyed up on one back then, can you remember that?!!!!
Dave!!!!!!!!!!!!!!!!

6417. Re: WHY you should NOT buy CB's Made in CHINA, Ms. Hicks !

Newsgroup: rec.radio.cb
Date: 2000-06-18 00:00:00 UTC
From: Dave or Debby <truth@planetc.com>
Message-ID: <394d62bb$1@news.planetc.com>
Source record: 40190

If you ARE interested in Quality then you would KNOW that ZERO quality comes out of a Made in China radio. Period. Don't matter if it is AM/FM, CB, Hambo, or whatever. Their commy system makes NO incentive to make quality, since everyone gets paid the same. Buying CB's made in Japan like I also did in '72 (Lafayette) doesn't make me or you "Japs." But when we buy from COMMUNISTS that want to KILL us, what does that say of us? I say that Lenin was right--some of you "capitalists" are stupid enough to buy the rope that they will sell us to hang US with! We WILL BURY you, uncle Kruschev said. Are they doing that today? So WHY should we buy their JUNK and have BAD quality to boot? WHY do you stick up for them?
Dave

'Doc wrote in message <37894fea.e9686072@usw-ex0105-037.remarq.com>...
I own several Kenwood radios, does that make me a 'Jap'? I'm
more interested in quality than in who makes it. So, I may very
well be 'crap', but I'm quality 'crap'...

This type of response... I found over the years from CB Techs is typical. They seem to feel threatened when asked to provide proof for some statements. Don't quite understand this stance. Questioning the validity of some statements is healthy and necessary in the overall learning process. I notice that some techs out here are "open minded" and don't have a temper tantrum every time someone asks for evidence instead of taking the attitude "how dare they question my knowledge". Just because you work with this stuff every day doesn't mean you know everything... and it takes a good tech to realize that.

Dave... you are truly obsessed with this "communist" thing. You need to move on and spend more of your waking hours doing something useful. Who are you to push your "democracy" on the world. Maybe they like their system. As far as the quality of products from these "communist" countries... consumers aren't stupid... if the quality to price ratio is as bad as you describe... then the word will get around and they will stop buying.

Dave,

When mounting a long antenna such as a whip, I'd choose the LEFT side due to hitting fewer limbs and low-hanging stuff. When mounting on a bumper (not really the best place), left or right won't make much difference.

73

6433. Re: Number assignments

Newsgroup: rec.radio.cb
Date: 2000-06-18 00:00:00 UTC
From: Rocketman <crylo@swbell.net>
Message-ID: <394D94CA.3B56CA1D@swbell.net>
Source record: 40206

Yes, the numbers are made up. It is mainly dedicated to sideband users and a lot of the older ham operators. The numbers are easier to understand over a long distance than some of the funny CB handles you hear. Most people use either 3 or 4 digit numbers, however, some people use their ham call sign like "KQR..525" you get the idea. Just make you up a set of numbers and use them. I prefer 3 digits, it is easier to remember than 4 digits or more. Mine is "822" or Rocketman on AM. I only use numbers on side band.

Hope this helps to answer your question.

The new Midlands or the older Midlands have the black faces or most of your smaller, compact radios have the black face. The new Midland am/ssb with the detachable face or the Midland Power Max would work well.

Like new 99v bought from exportradios radio has been super tuned and converted to 11 mtr works like new never mobile used as base briefly them put back into ori box less than 2 mths old.
this radio has not one scratch and is as new as one can get its like getting it from dealer.
I put up antenna in my housing addition and home owner ass made me take it down so I am selling off the radio.
well sell for $300.00 OBO
comes with box, manual ,mike and all mounting hardware.
Will ship cod.
email with any question of if interested.

I guess my first consideration would be getting it out of harms way,
the side is fine mount it as high up as possible, remember though you have
to drill some pretty large holes to mount that ball..... I prefer body
mount rather than bumper but thats my personal opinion.....

6440. Re: Amp Question

Newsgroup: rec.radio.cb
Date: 2000-06-18 00:00:00 UTC
From: Professor <bgriffey@kwom.com>
Message-ID: <e3f35.36108$Q7.696410@news-east.usenetserver.com>
Source record: 40213

I guess you're talking about "compression" of an amplifier where at the high end of the output range you are no longer in a linear mode. I certainly agree with this... and you would certainly be right in saying that the audio quality will suffer as a result. The farther you get into this compression regoin... the more audio distortion you will get. The problem is that most amps out there operate in that "compression region" when hooked to an out-of-the-box set. People don't seem to realize that when they add an amp that the drive from the set needs to be altered to bring them back to the linear portion of the amplifiers output in order to sound clear...

Type up a formal complaint to the FCC. Then before you send it,
give your neighbor a copy. Inform him that the original will be sent
in three days unless he gets with you to resolve the problem.

That's not right. Always go on the "high" side of
the road. The high side is always the drivers side
(closest to the center of the road). That way you
hit fewer things.

> but if you are familiar with the Jeep
> Wrangler, exactly where? Inside the "loop," outside the "loop," on the
> outside of the "loop" itself... etc.

A chain type bumper mount adapts to almost any
bumper shape. With a ball mount you need a flat
surface that you can poke holes in without killing
yourself. Bumper metal is usually thick and heavy.
I don't recommend trying to mount a ball mount to
a bumper unless you have the proper tools.

> What is the best bet here?

As far to the drivers side as you can go (assuming
a chain mount). The drivers side rear fender is
where you should mount a ball mount.

> Thanks,
> Dave

Good luck.

Bill, He's already picked up a Ball mount, My experience with chain mounts has been poor, the ones i've had always came loose and corroded quite quickly, of course not everyone lives in the salt-belt, but yeah, the drivers side would be best.....

I had this sorta problem years ago. I tries to ask my neighbor to cut it down and he told me to go fuck myself. Thats when I grabbed him , beat the shit out of him, and was I taken to jail. The FCC was notified by local law enforcement. FCC went to the residence by request and I never heard him again. I pleaded to a disorderly and paid a fine.

6455. Re: whats some good ways to get a agitator to stop agitatin

This gets better yet. Numbers I use with Buell and Nebo huh? This would not be if I did not know the things I am hiding? What the hell does that mean? Oh well, I always enjoy a great conspiracy theory. And if Buell has a web page, I never saw it. But you got my curiosity. Buell, send me your web page so I may activate my decoder ring and teledemolecularizationtransponder.

My post doesn't recommend the chain mount.

I'm just trying to make the best recommendations
I can based on the info at hand.

With chain mounts I recommend the use of counter-
poise wires to relieve the mount's ground respon-
sibility.

Hopefully, this guy will choose the best path--
which is to mount the ball to the driver's side
rear fender.

The problem is that the stupid and the ignorant are quick to challenge
and waste the time of the smart.

You fall desparately into the stupid *AND* ignorant catagory. That's
why you are one of the most vocal challengers.

>driver would be better..Could someone tell me the difference between the
>two.. And what is a good brand to use..

With a single final Galaxy radio that peaks app. 30w into an X-Force with (2) 22's it will peak 25w less than a Connex (123 built) with (2) 14's. The swr in and out of both were nearly identical. If you currently have the box with (2) 22's, I'd stick with it, the difference is not worth the loss of selling one and buying the other for 25w, also the 22's will run easier at that input than the 14's.

Disconnect and put the coax where? Unless you have a separate connection for that coax that shunts it to ground, disconnection won't do beans to prevent a tragedy. Of course grounding the antenna "invites" a way for the lightning to ground, SHOULD it strike. Where else would you have it go? Only a fool/novice would not ground an antenna.

I didn't take it personally at all. What I am saying is that the comments about FM on HF are those that are likely from someone who has never experienced anything significantly below CB. Try FM on something like14 or 7 MHz and you'd understand that it doesn't work most of the time. Yes there are times when FM is readable but that is rare.

I have been following this thing for awhile concerning the availability of Galaxys, etc. Nowhere can I find reference to the feds banning theses radios. Where did you attain this info? Galaxy makes legitimate 10 meter radios. Pure junk in some eyes, but nevertheless they continue to be readily available. If you are referring to the feds requiring the mods be harder or impossible to do, this has been going on for years. But to say the feds banned them is quite erroneous..

6490. 98 Mercury Sable - Power Feed / AirCon and Fan noise

Newsgroup: rec.radio.cb
Date: 2000-06-19 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <mrr35.12329$qS3.31903@tor-nn1.netcom.ca>
Source record: 40263

Anybody know a good spot to bring battery power through from the engine compartment to power an underdash mounted CB in a 98 Mercury Sable ? Apart from drilling a new hole in the firewall (bit of a hit and miss practice), it seems it may not be easy. I have been temporarily running the CB from the cigarette lighter (probably the worst place I know), but it is proving to be too noisy (even with a power filter) to be a permanent solution. Failing that, is there a place inside the car to pick up a decent "clean" power feed ?

I have also tried grounding the radio chassis to the car chassis, and also grounding the CB -ve power lead to the car chassis, but it seems to make matters worse!

Finally, does anybody have any tips on killing noise generated by the AirCon and the heater fan ?

Thanks,

Richard.

"A. Secret",
sounds like you have a grounding and 'over load' problem.
Make sure the radio and antenna are properly grounded. Power
leads go directly to the battery (not the fuse block). If you
still have the problem, you might try 'by-passing' the power
lead to the radio. Good luck...
'Doc

Richard,
If you can't find any other entry point, pull up the
carpet an use on of the'knock-outs' you'll find in the
floor. Be sure to use a grommet or some other shield
to prevent sharp edges from cutting the power lead(s).
Leave the filter on the radio power lead, then, by-pass
the A/C motor with capacitors, that ought to help the
noise problem. Get ready to do the same thing to the
fuel pump... your gonna love that!

Wrapping the windshield wipers in a Lead Tape would do the trick also....
It would keep the RF from entering them.

What also should dissappear of of Ebay are those 2m and 70cm ham rigs that can be modified by simply cutting a wire. Why? Well, with just a few minutes time you can have a radio that transmits on Fire, Police, and Government frequencies. 10m radios are a big problem? How about the nutcase that decides to jam the local fire frequency? Those antenna systems have an incredible amount of gain on them so less than a watt is needed. I have never seen an RCI or Galaxy radio that goes up that high. Alinco, Yaesu, well maybe.....

You would never know where dave got his design, because you are an internet newbie just like all the rest!
dave has been doing this way before 123 was hired to help and the internet wasn't even started yet.
All new ducks!
Copy Copy Copy!
dave should be impressed. all they do on this newsgroup is talk about him and by proxy suck dave's dick.
Sure dave wasn't the first but, he has done things that others haven't and if he was not impressive with his design and other things why would he be copied and talked about by so many??????????
Bingo!

Sunshine wrote:
>
> Bill the drivers are the ones that have variables on them ..it is not a
> common thing on competition amps
> just the driver.

The amps that have driver stages in them have
variable pots too. The XT-400s that I've
personally dealt with had variable pots and
were designed as stand alone amps (unless you
intend to use them as drivers for say 16 pill
boxes).

If you think about it, any amp can be a driver.
I don't think it's as cut-and-dried as you think.

I believe the multi-stage amps that are meant
to stand alone will have variable pots in them.

I'm not a comp amp expert. I just offered my
guess and a little info based on my experience.

In the end we agree anyway. The X-80 could be
used as a stand alone amp, but is probably meant
to be a driver, therefore it's very likely that
it has a variable pot in it. That's the bottom
line in a nutshell.

I beleive one aggitator here had his address and telephone number spread acros
the region. He came on the air one night complaining of the 2 AM phone calls.
After a month or so he was never heard from again.

Well Guys,

Having read this thread, I think the Fed route is the way to go. You see, the complainant and his neighbor have already been into it over this and the offending CBer told him to F*** Off. So if he does any-DIRECTLY against the bad guy, then likely he would be the first sus-pect. This could excalate into somebody getting hurt. For me, my radio hobby is not so important to risk that. Best to get it handled by the FCC guys. That way, should the bad op threaten the complainant, it would be on record, and the "keyed on" CBer would have legal recourse in that event also. After all, the guy has told him to f*** off, so I reckon that means he intends to keep on his evil ways, right? Not much else to do as I see it.

Hello,

The general gist of this thread, I guess, is that there IS no foolproof way to stop a lightning strike. But, IMHO, an ungrounded antenna does build up static which attracts lightning, which is itself a "static" charge. I do know this: I won't ever put a coax in a glass jar.

Wrong, mounting it on left bumper will yield more of a signal to the right
since this is where
the most ground plane(metal) will be.
Mount it dead middle of bumper and be assured your signal is going the same
exact way you
are driving.

> boxes).

Bill the amps that have driver stages in them are the only ones with
variables...
yes, you can use the "driver" amp as stand alone amp that is not even in
question
. In competition better results are normally had by running a
straight 2pill or 4pill etc with an external driver amp, as compared to
running a 1x2, or 2x4

>
> If you think about it, any amp can be a driver.
> I don't think it's as cut-and-dried as you think.
>
> I believe the multi-stage amps that are meant
> to stand alone will have variable pots in them.

This is pretty much a given If it was meant to stand alone then it will need
a driver stage and
a variable comes into play since it will be (normally) driven with a
lo-watt cb and will not provide the amount of drive needed by a multi stage
amp. The variable
pots job is to limit the amount of drive (watts) out of the driver stage
which in turn limits the
overall output of the amp.

> http://www.dxzone.com
KP,
If you haven't already, go to www.rainreport.com and read some of the
things being done about that. In every group, there are bad apples, and
ham radio has its share. But Hollingsworth IS doing something about it,
and that's more than was being done in years past. I know that FCC has
upgraded their monitoring station in Maryland, and it seems to be doing
its job. Mr "H" also hit some unlicensed ops, other jammers, and hit
a taxicab company in Alaska for using 2 meters and 70 cm (warning).
Ham radio in and of itself is not a bad thing, and I often check into
the Maritime Mobile Net on 14.300. Recently, I listened as several
stations assisted a sailing ketch off the coast of Argentina that lost
its main mast AND its diesel engine. Thru their efforts, help was dir-
ected to the vessel quickly. It was very serious because seas were
heavy and if the boat weren't taken under tow fast, it would take on
water and sink. I don't come in here to criticize, and I don't take
part in flame wars. I just enjoy reading the informative posts and try
to learn something I might use both in CB and ham.

It is easy to point out flaws and bad operators anywhere--I can go to
any given frequency on both CB and ham and find examples of this. But
if you can get past the overbearing hams--and there are some of those in
here--you might find ham radio is just as much fun--maybe even more so
than CB. When you run into those "WE are better than you" types, peace
is only a dial spin away.

Working with farts you are undoubtedly the king. However transmitting
them is even new to you. Why don't you just go back to huffing them
and leave the CB radio out of it?

KW,

With respect to your position on placement of a 102" whip, do you think it would make THAT much difference? The reason I ask is that due to the average length of most vehicles, and a Jeep being even shorter, I believe it would not make enough difference to really tell. Now that is just an opinion, and is in no way meant to challenge your point. I know it makes very little difference at lower frequencies (below 27 mhz), and I have read articles that propose that it doesn't make any significant difference until you get up to VHF. Has anyone ever really tested this? I'm just wondering.

KW,
Before I did some snooping around and did some grounding and bypassing some power leads, not only would my wipers come on, but I would get a windshield wash, too! Before I got the issue resolved, I used up a whole bottle of that 99 cent washer fluid from Kmart! One consolation was that during this little episode, no bug remains could stay on MY windshield for very long! LOL! LOL! People gave me some funny looks, too. I guess they thought I was obsessed with a clean windshield!

6562. Ranger RCI 2950 squelch problem.

Newsgroup: rec.radio.cb
Date: 2000-06-19 00:00:00 UTC
From: Darren <darren@spam.org.uk>
Message-ID: <8im529$e1u$1@neptunium.btinternet.com>
Source record: 40335

Hello again everyone.

After sorting out my variable power problem mentioned earlier, I now have a new problem a few days later. I bought a brand new Ranger to avoid the need to fix it like this.

Squelch seems always up. The busy light on the LCD works ok with the squelch control suggesting that the wiring from the control pot to the board is fine. I've traced it around the board a bit and tried swapping out a few '945' transistors I thought may be to blame (probably missed loads of things, but worth a try)

The audio IC is fine and PA works a dream. The external speaker socket isnt to blame (tried one rather than the internal spkr). Also tested the operation of the relay that switches output to the PA socket. This is fine. All the regulators seem ok. Varying the squelch control does vary voltages that I've traced part way round the board, so I guess the problem is linked with the actual switching (transistor?) side further down the squelch circuit.

I'm guessing its a squelch problem as the symptoms of very distant hiss from speaker when on full volume suggest this. I've manually adjusted the pots on the board for the squelch threshold, although these were fine a few days ago. Agan, it's a radio only a few weeks old and I now wish that I'd not gone this far and swapped out a few components in order to source the problem - I should have sent it back....too late now anyway.

Does anyone know which are the main transistors/diodes or whatever that are used to switch the squelch in (ie the ones that are cutting my audio).

For reference. my radio is the french CRT badged version of the ranger although all schematics etc seem to suggest its identical to a brand new Ranger model.

Many thanks in advance,

Darren

Here's the problem. I have a fellow radio enthusiast who lives about 2 city blocks away from me. I live in a big city, so I can't be the only one in the neighborhood that has the same problem.

When ever this guy operates, he runs BIG power and operates on 26.395mhx. He wipes out the sound on my PC and bleeds over on the television. I have asked him like a gentleman to turn down the power, a little. He has told me to go fuck myself.

Does anyone have any ideas, before I have to notify the men in suits. http://www.fcc.gov/

I don't want to be a scummer, but what other options do I have? Thanks in advance.....

Does your problem occur on both AM and SSB? If SSB is OK then your problem is probably the transistor mounted to the right side of the chassis frame near the rear or the circuits associated with this transistor. Measure the voltage on the collector of the final when transmitting.

Thanks for the reply.

But....

These batteries were new. I tried 3 sets and at least 2 different
chargers! The memory effect takes time to build up (thaye talk of
dischaarge/charge needed every couple of months of heavy use) . I have
tried discharging and charging in case.

NiMh batteries would work, I know, but iut means a new charger (two if
I want to charge both radios at ponce) and rather weakens the calaim
that the radios will work with NiCds.

Maybe nobody _uses_ these radios <G> :-(

There's one day left on this auction at ebay.

The transceiver is a Cherokee AH-27. It's barely used and in mint condition. It retails for over 150 bucks American when new. The current price in the auction is $30.00 Canadian, which is about 20 bucks American. It's a great deal, and comes with batteries, and 27mHz antenna.

Here's the link, and this is the last time I'll post this:

http://cgi.ca.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=354836521

Feel free to email me if you have any questions.

> >variable??

I can't say for sure, but my guess is yes.

All the X-Force amps I've ever seen have a
variable pot. That seems to be a popular
feature with the competition amps. The
X-80 is designed to be a driver--that's why
it uses 2290s rather than 2879s. With that
in mind, you know a variable pot will be
included.

The lowest frequency in the sideband will contain the largest
percentage of the original power, the third harmonic will contain
the next greatest amount, the fifth harmonic the next greatest, etc.

For example, let's assume a 20 MHz carrier modulated with a 10 KHz
square wave. The resulting signal will consist of a whole bunch of
sinusoids at different frequencies. There will be the original
carrier at 20 MHz. There will be the sinusoid with the greatest
amount of power in the lower sideband at 19.990 MHz. There will be
a sinusoid with the next highest amount of power at 19.980 MHz -etc.
Note that these frequencies are moving away from the frequency of
the carrier. The same is true for the upper sideband, which will
be a mirror image of the lower sideband.

So, what is your point?

:> If you looked at the signal on a spectrum analyzer, you would see
:> three signals. There would be the 60 Hz signal, a 59 Hz signal and
:> a 61 Hz signal.
:>
:> Pretend that we have a selective enough set of filters so that we
:> can pass the 60 Hz signal on to you - and pass me the 59 and 61 Hz
:> signals.
:>
:> I will happily pay for the power I consume from that 1 Hz signal
:> and you should happily pay for the power you consume from the 60 Hz
:> signal. No, we shouldn't split the bill. As the 1 Hz signal is
:> modulating the 60 Hz signal, the sidebands only contain only half
:> the power of the 60 Hz signal.

: I'm not talking about sidebands. I'm talking about the signal in
: the time domain. I want the time when a scope shows a signal.

: I'm offering you the time when the scope shows no signal. You
: claim that there is power there. I'll tell you what. You only
: have to pay 40% of the bill. I'm cutting you a deal to show how
: generous I am.

And what I am saying is that your monitor scope is showing a composite
of the power that is there. Whether it shows zero power or not is
immaterial - if I pay for what is in the sidebands and you pay what
is in the carrier.

If I am to pay for power when the scope shows zero power, then I would
want to pay for only the percentage of time that it is zero. As that
time is essentially zero, I would not be paying anything.

:> To quote from the Radio Amateur's Handbook "The amplitude of the
:> modulation envelope varies from instant to instant in the same way
:> as the complex audio-frequency signal causing the modulation. Even
:> in this case the CARRIER (emphasis is in the text) amplitude is
:> constant if the amplifier is properly modulated.
:>
:> Also: "The extra power that is contained in a modulated signal goes
:> entirely into the sidebands, half in the upper sideband and half in
:> the lower."
:>
:> And: "Supplying this additional power for the sidebands is the object
:> of all of the various systems devised for amplitude modulation".
:>
:> Electronics texts on modulation systems all state exactly the same thing.
:> If they were not buried in a box somewhere, I could dig out half a dozen
:> of them to provide quotations.
:>
:> If you cannot understand what the above statements state it is this:
:> The carrier is unaffected by the modulation, as long as the amplifier
:> is properly modulated (the power supply can provide enough power for
:> both the carrier and modulation etc).

: OK. So what's the holdup? Are you going to buy your half of
: the line voltage? The Radio Amateur's Handbook even says that the
: 60 Hz is there. Let's call the electric company and get hooked up.

What does this have to do with the discussion?

Hello
After reading this thread I see that you guys think the FCC can't and
shouldn't do anything to CB'ers unless you are the one being interfered
with. Then you want them to do something or you decide to beat the heck out
of the guy. I guess if none of the above work you are going to tell this guy
to go put the other guys antenna down.
Why don't you guys just follow the rules get rid of the amps and most of
your problems will go away, or better yet get a license and then you can run
big power legally and shoot skip legally.
On another note has anyone noticed that the Galaxy RCI and Ranger rigs are
disappearing off Ebay? That is because the FCC has banned them in the US and
Ebay has ended all auctions as soon as they are notified of the auctions. It
is just a matter of time before all the illegal 10/11 meter only amps will
be gone also.
Have a Nice Day

With his attitude you will be wasting your time to pursue it further
with him, go directly to the FCC and let them deal with it. He deserves
what ever he gets, these are the kind of jerks that should not be on the
air.

: on lcd display when keyed. All other functions seem to work . Any help
: would
: be greatly appreciated. Also need schematic. Thanks in advance.

I can think of about half a dozen things that could cause the problem.
Do you have access to an oscilloscope with an rf probe? How do you know
that the output transistors are ok? Testing them with an ohmmeter tells
you little - except that they are not open or shorted to dc power. They
could still be fubar as far as rf goes.

The most probable cause is your B+ (collector supply voltage) is missing
for some reason. There are a number of things that could cause this.

In a previous post I posted: (in reference to stainless whips)

Re: Whip Question Date: Sun, 11 Jun 2000 20:08:18 -0400

Is your Jeep at TJ or a YJ? YJ's mount antennas on the tire stop.
TJ's mount antennas on the back bumper or Firestik has a hood mount.

Except for the way the whip is installed into the 3/8" stud, they are
all similar. Most 4x4 clubs don't allow full size whips during runs
because the antenna "whips around" and can cause injury to bystanders
and spotters. A KW-7 Firestik won't whip like steel and seems to match
better to the back bumper of a TJ. Happy Jeeping.

Don't buy Quadratec's $100 CB bumper mount. I can buy it locally for $30.
Their Uniden radio is also way overpriced...

TJ (continued)
Take the plastic "loops" off the ends of the back bumper. Drill out one
hole to 1/2". Insert a 21-961 stud mount through the enlarged hole.
If you lift the back carpet, there is a grommet you can poke a hole in
and feed your coax. Get a 1/2" ring terminal and add a proper ground
braid and star washer to keep on keeping on!

All Gear working last time tested unless noted. Shipping is extra. Please reply to my email address.
Thanks

Tempo-1: All Tube Ham Transceiver with Power Supply. Covers 80-10 meters. Looks good and works well. $200

Pearce Simpson: Guardian 23- All tube CB Transceiver/with mobile power cord and mounting bracket. Looks and works Good. $100

Swan 14X DC Power Supply Module: No way to test but was told it was working OK. As is $45.

Siltronix Model 90-6 VFO: Excellent condition with three position crystal switch $60.

Marantz Model 2220B: Stereophonic Receiver, with gyro-touch tuning, blue dial and optional real wood case. This unit is in excellent condition, both in looks and operation. I would rate a 9.7. Also have original manual, in excellent condition. $175

AR Inc: Stereo Amp, All solid state. $100. Please don't ask the model #. I have been asked this many times and unable to locate on the name plate. The serial # is: AA002291. It comes with the optinal wood case the face is Gold Alumi. With the following controls: Mode selector, Bass, Treble, balance and volume. In the upper left corner is a red LED and on the bottom right is a normal/monitor switch. I would rate it a 7 on appearance.

Channel Master: Tube Stereo Receiver (Model 6612) and matching amp (Model 6601) Looks good and plays on FM only. AM not working. $100

Traynor: Group Two B- Audio Amp Head. High/ Low misc. in puts. Master volume,
volume, bass, treble and tone shaper controls. All solid state $125

PRO 2003 Scanner: Radio Shack 50 channel(30-512 Mhz.) Digital Scanner with FM broadcast band included. Have two, one is working the other is a complete non working unit. $115 for both.

Bearcat 250 Scanner: Have two. One working at times and one for parts. $50 for both.

RS Pro 30 Scanner: Hand held 16 channel Digital scanner. Looks & Works good, but the battery cover plate is missing $35.

Source record: 40387

Disconnect. Provide a nice way for the burst of energy to get
to ground if you like. BTW, consider a strike as a humungous
great big pulse of microwave - the rise time of the waveform
means that you're dealing with something akin to SHF, which
doesn't like going around sharp corners (inductance). Keep
your heavy cables / lead strips fairly straight.

High speed photography has revealed that when the local
atmosphere is saturated with charge, spikes reach out
BOTH upwards from various points on the ground, and "leader
strikes" from above. When two connect, the energy from above
is delivered in the main strike.

So, in my opinion, grounding your antenna is just INVITING the
lightning to choose your nicely provided path to ground!

I'll stick to loft antennas, thanks :o)

>All the X-Force amps I've ever seen have a variable pot. That seems to be a popular
>feature with the competition amps.

The only X-Force amps with variables contain 2290's in a single or paired configuration. ie: X-40 (1-2290), X-80 (2-2290), X-200 (1-2290x2-2879), X-400 (2-2290x4-2879), etc.

I don't thinks so Brian,
I've said it before, I was here when it was only
Dennis, Sean and a few others. Unix based
commands, & pine editor, so I won't be going
away soon. You on the other hand disappear
all the time, just like when you were trying to
sell your homemade linears over the newsgroups.
You thought you were going to get busted, so
you folded up your tents and disappeared.
I would be careful how you state that you are
making, have, using, selling a linear for use on the cb
channels. There are people still out here that report
this stuff all the time to the F.C.C.

Source record: 40393

> Why don't you guys just follow the rules get rid of the amps and most of
>your problems will go away, or better yet get a license and then you can run
>big power legally and shoot skip legally.

While I agree with this sentiment (mostly) in spirit, the problem has more to
do with attitude of the operator than anything else.
Even if one does have an amateur license, his/her interference could still be a
problem, and unless that amateur had the proper, workable attitude towards
resolving the neighbor's complaint, that neighbor is still going to be in the
same boat.
Personally I feel 'lin-yers' and such are a huge nuisance more than anything
else, which may not be a popular view in a CB room! :-)
But this particular circumstance is an ongoing problem not because of the
interference, which is otherwise fixable, but because of the fact that the
person causing it doesn't care one whit about anyone else.
Licensed or not, that PERSON is the problem.
Linus

Oh the worst gotta be the EF Johnsons made right before the change to 40 channel. The last 23 channel rigs were pure trash. And then the 40 channel rigs they came out with seemed to validate all the 'legends' about the 40 channel stuff being worse than the 23 channel. I don't know how Johnson could have made a radio worse than those last production 23 channel rigs, but they sure found a way!

> Maybe we can a discount by combining our buying power.
> I'm in. How about you?

[Bill's talk of sidebands snipped]
> So, what is your point?

I was going to ask you the same thing. I wasn't offering to sell you merely sidebands. I was offering to sell the the whole low portion of the signal as seen in the time domain on a scope. You get all of the sidebands *and* carrier that you find there. You claim it is there. I am here to make you a killer deal on it.

OK, maybe my first offer was a little confusing. Let me try a different offer. For a single one-time fee of $1000, I will provide you with all the power that you can draw -- for the rest of your life!!! -- from the low side of this 1 Hz square-wave modulated, 60 Hz waveform. I know that these dumb ol' scopes show zero volts but you know that there is power there! I will provide you will all the current you can pull -- for the rest of your life!!! -- from this zero volt signal. You can hook up all the air conditioners and appliances you want and I won't mind! Honest! You can install 1000 amp service. I guarantee that you will get your zero volts. And I can deliver!

Bill, you will be set for life! Imagine no more electric bills for the rest of your life. I am saving you thousands -- perhaps tens of thousands of dollars. There is no way on earth that you could possibly turn this offer down.

That is unless somehow when this confabulated composite signal goes to zero for those 1/2 second intervals, there is no power there. That means you would be paying for nothing. Aw, but what am I talking about? You know there is power there. Bill, you have just won the lottery! ...the zero volt lottery!

Email me privately for an address to send your $1000 payment.

> And what I am saying is that your monitor scope is showing a composite
> of the power that is there. Whether it shows zero power or not is
> immaterial - if I pay for what is in the sidebands and you pay what
> is in the carrier.

Bill, I will not shortchange you. You get EVERYTHING, carrier *and* sidebands, found in that zero volt portion of the signal.

> If I am to pay for power when the scope shows zero power, then I would
> want to pay for only the percentage of time that it is zero. As that
> time is essentially zero, I would not be paying anything.

Oh, no. This signal described is zero for 50% of the time. The description was very explicit. The 60 Hz is modulated with a 1 Hz square wave.

But, since you seem like a nice guy, I am willing to give you this new offer that gives you zero volts for 100% of the time. Maybe some other flim-flam artists would attempt to sell you 50% but I give you 100%.

Everything. You're saying the power is there when the voltage is zero.
I'm here to sell you all the zero-voltage power that you can handle.

Hello,

I�m looking for experiences with Yagi - Antennas / Mini-Beams for 11m

Is it possible to make connections (DX) from Germany to other
countries without using more than the legal 4 Watt.

Anybody using this antenna or other Mini-Beams ?

WiMo Antennen GmbH ZX-YAGI Monoband KW-Beams.htm

11m-Band (CB)
ZX11-2

THANKS IN ADVANCE !

Martin

You are way out there bubba blue. You come out of nowhere and rattle on about secret clubs and then you babble about myself and Nebo with hidden numbers and then you bring some one else called beedman into the discussion and ramble on about antennas and capacitors and fools. Don't know what kind of substances you are on, but you are one whacked dude. Your posts appear as if they were written by a paranoid-schizophrenic, delusional, introverted, spelling-challenged adolescent. You cease to amuse me. Hope you find whatever it is you are seeking. On second thought, you are not really paranoid if everyone IS out to get you. Have a good night!

6641. Opinions on Monkey Made Antennas

Newsgroup: rec.radio.cb
Date: 2000-06-20 00:00:00 UTC
From: maniac9188@aol.com
Message-ID: <20000620025821.26123.00004969@ng-cu1.aol.com>
Source record: 40464

I am SERIOUSLY thinking of buying a Monkey Made Antenna...I have a 1993 Chevrolet Beretta GT.., With a Stargun ball mount on the trunk. I don't care for the Stargun line of antennas due to the mixture of different metals on the same antenna (i.e., aluminum.., and brass/copper).. I had a "55", but the shaft length isn't long enough to get over the roof.. The monkey made LOOKS like a "55".., but does it perform as well?? I want it only because of the longer shaft.. Please tell me if this antenna is worth buying....If it is not, please point out your personal choice

Sorry, No Wilson or K40 suggestions, please

Feel free to email, I don't get into this NG often...., Thanks

Maniac "373"

Well, I'd like to see the manufacturers realize that it shouldn't be 'all or nothing'. Alinco for example has a 'single' mod to 'open up' my DR-590. Without the mod, I can't do cross band repeat. But once I do the mod the rig will transmit (or try to) anywhere it can receive. And while it might be fun to have 35W on FRS, it's not really what I want! In fact, it's a pain since the mod to open the thing up to use cross band repeat changed the 'mode' of how the tuning works, and now it's a PITA.

RS has a 'two step' mod to the HTX-242 for example. One mod 'opens' the rig up to MARS and CAP frequencies. The other 'opens' the rig up to 'hear it say it' mode.

Mike

Why were they bad? I didn't know that. Were they made in the USA before they moved to Japan, or did they make some 40's here? Maybe the workers got the word that their jobs were going to Japan & did a lousy job, JUST LIKE the Connex's were mostly bad right before they left Taiwan in the 80's! Dave!!!!!!

Mike Yetsko wrote in message ...
Oh the worst gotta be the EF Johnsons made right before the change to 40 channel. The last 23 channel rigs were pure trash. And then the 40 channel rigs they came out with seemed to validate all the 'legends' about the 40 channel stuff being worse than the 23 channel. I don't know how Johnson could have made a radio worse than those last production 23 channel rigs, but they sure found a way!

No problem here 'ol blue. I do not ride channel 12. Do not think I ever talked on channel 12. If you want, you may find me on lower 38 or the bowl or channel 3. I repeat, I do not belong to an "illegal" dx club. If you want to discuss antenna theory or capacitors, that is fine. Never claimed to be a tech or anything even remotely similar. I do some basics to my radios and I have built a few dipoles and such. I challenge no one unless I am pretty sure they are wrong or mistaken. I assure you, I am not whoever you may think I am. I have nothing to hide and the ONLY numbers I ever use are 1175 and 988. Whatever you refer to in the way of tech advice, I am all ears. But you lost me talking about antennas and capacitors. Do not know where that came from. Nothing personal about the name blue, but I do remember a comment in this thread about you alluding to a "fool". Whats good for the goose.....Anyways, I will try to hear you out there. No hard feelings. Legality of issues? We can talk all day. I run a clean base station. But I will try channel 12 so you can hear me and judge for yourself. You have my numbers, what are yours? 3s

Good man--No Wilson or K 40's--I love it!
I would say NOT to buy a monkey antenna unless you are a monkey. It is a BIG power antenna and unless you have BIG power, it is overkill & a waste of $$$$. How about a 5.5' Francis or a 55" Hustler, or 1 of my 108 1/2 whips? Monkeys designed the monkey antenna because the coil is at the base instead of up higher. I love anything that is stainless steel, but the hole in yo wallet will make a Monkey out of you!
Dave!!!!!

Maniac9188 wrote in message
<20000620025821.26123.00004969@ng-cu1.aol.com>...
I am SERIOUSLY thinking of buying a Monkey Made Antenna...I have a 1993 Chevrolet Beretta GT.., With a Stargun ball mount on the trunk. I don't care for the Stargun line of antennas due to the mixture of different metals on the
same antenna (i.e., aluminum.., and brass/copper).. I had a "55", but the shaft
length isn't long enough to get over the roof.. The monkey made LOOKS like a "55".., but does it perform as well?? I want it only because of the longer shaft.. Please tell me if this antenna is worth buying....If it is not, please
point out your personal choice

Sorry, No Wilson or K40 suggestions, please

Feel free to email, I don't get into this NG often...., Thanks

Well, Dave, That's YOUR opinion. How do you KNOW that? I enjoy those "Hambo" frequencies you seem to hate. I enjoy making a contact to the MIR space station with a 2 watt handheld. I like being able to make local phone calls from the car (autopatch) without paying cell charges. I get a kick out of building stuff, trying it, refining it, and seeing the finished piece of gear or antenna work as I had hoped. For me, it was the other way around (CB wanna Bees?): I started with a CB radio, enjoyed the heck out of it, and simply wanted more and to KNOW more. I remember having an old Raytheon 5 channel CB. All the antenna I had was a Rat Shack thingy that screwed onto the back of the set. Spent many hours sitting on the edge of the bed talking all over my town to really good people. In the same way, I enjoy those "hambo" frequencies you disparage. For me it offers more bands, more projects to do, and a chance to learn more than I ever would on CB. That's NOT a flame, a dig at CBers, NOR is it a putdown. It's just that there is much more to the ham hobby than talking on the radio. I bet I have burned up more wire, tubes, coils, chokes than you can imagine. I bet the mistakes I have made trying to get something to work would give you more to laugh about than you can imagine, either. I lost a couple of homebrew radios this way, and while I wasn't amused at the time, each of these failures and stuff gone up in smoke taught me something--well, most of the time! So the next time I tried the same type of project, I had learned at least one thing: Don't do it the same way THIS time. And I don't know "it" (whatever "it" is) all, either. I'm just a guy who likes radio, the more radio the better--used to drive my wife crazy--and the only way to satisfy is more radio. I still use the CB, always have from the beginning, and I DX on the ham bands. A Wanna Bee? I doubt it. I just wish those guys with the "superiority" complexes would quit preaching just because they have a license. Sure, I have one, too. So? Does that make me BAD?

>NOT
>IF THIS MORON IS USING ILLEGAL AMOUNTS OF POWER!! (sometimes it's like
>talking to
>a brick wall with you people)

First, take a deep breath and relax, I was pointing out a general concept
regarding interference problems. The best advice has already been given,
namely, that the guy should go to the FCC with the problem.
Second, OF COURSE the excessive power is illegal, and that makes the offender's
intransigent attitude that much more destructive to resolving the problem.
But not all interference comes from illegal equipment, and not all neighbors
who have complaints are out to get you, and not all operators who cause
interference are blind to the problem.
That's all I've been trying to say.
Linus

==========
heck with #12 i agree 110% on that ...experimenting and understanding why
something happens
gets results... From my understanding dave worked on radio station broadcast
amplifiers in the early years
b amps i am sure he learned on his own by reading and trial and error, and
experimenting
by modifiying TX Stars,TNT, and whatever else was out there. He learned how
not to build an amp
by upgrading and improving and what yielded the best results .

#1)Does #12 know Dave personally??
thats ok i'll answer for you NO! Has he ever spoken to him?
I'll also answer that for you NO! So other than heresay how would he know
where dave got anything ?

#2)I guess that means the current line of xforce base amps that bears the
#12 for him designing
is daves design and not his. I mean it is a davemade amp with lass b bias,
which is only a few diodes
resistors and a few caps

On Christmas morning, a cop on horseback was sitting at a traffic light, and next to him was a kid on his shiny new bike. The cop said to the kid, "Nice bike you got there. Did Santa bring that to you?"
The kid said, "Yeah."
The cop said, "Well next year, tell Santa to put a taillight on that bike." The cop then proceeded to issue the kid a $20.00 bicycle safety violation ticket.
The kid took the ticket. Before he rode off he said, "By the way, that's a nice horse you got there. Did Santa bring that to you?"
Humoring the kid, the cop said, "Yeah, he sure did."
The kid said, "Well next year tell Santa to put the dick underneath the horse, instead of on top."

Actually, you are quite correct that the FCC is escalating enforcement issues. Check out rainreport for confirmation. But who are they going after? Not the occasional freebander with some smoke behind his station that they receive 1, 10, or even a full petition of complaints about. It is the malicous operator that is interfering with a frequency that may be deemed a safety issue by the FCC.(Quite a broad spectrum) If an entity with a financial interest, no matter how remote, files the complaint, it will usually achieve swift results. The little guy has the lowest status and priority.

> > straight (low-drive) daily-use 4-pills use
> > 1446s.
> ---
> In whose opinion are these(4pills) the best? Yours ...Hardly ...

The increased efficiency and gain of the device
when used in a two pair configuration with a
low power driver dictates that it's the best.
It's the design in general and not a specific
amp that I'm talking about.

> An excellent (and economical) kilowatt
> > PEP daily-use CB amp design is the one-driving-
> > eight using 1446s.
> ==========
> I can get 1kw with 1 driving 4- 2879's why do you need an 8 pill ...Hardly
> economical...

The eight using 1446s is more efficient and reliable.
That's why M4Vs and similar designs have been popular
for so long.

> I'm just not convinced that
> > the 1446 is a better device in a driver/modulator

> wire to supply units being tested. The pair of 1446's in the SAME CHASSIS
> DESIGN did outperform 2290's with typical radio drive.

1446s are more efficient. Therefore they put less of
a load on the output transformer and associated power
supply circuitry. In a chassis originally designed
for 3/8" flange devices, 1/2" flange devices will come
up short. I'm not denying your test results--I'm just
trying to explain them.

> As to the comment of a
> radio can drive each equally into saturation or full output is crap.

No it's not. I was talking about the gain compressed
region--not total saturation.

> A pair of
> 2290's will take up to as much as 90w pep before saturation, wheras a pair of
> 14's will saturate at half that.

Gain compression and saturation are two different things.

> Hence the reason that a pair of 14's will
> outperform the 22's at typical radio drive (30w pep).

Because the 2290s reach full saturation at a higher
wattage doesn't mean they have less small signal
gain. In fact, with 30 watts in, the 1446s will
be running in a deeper state of gain compression
than the 2290s. That's another reason why the
2290s will show a higher output at that drive
level.

> It's not by much, but
> they do perform better. The 22's show about 90-100 and the 14's about 110-120
> on the Bird 43. Just because you haven't tried it, doesn't make it untrue.

Because my test results differ from yours is what
makes it untrue. The test circuit for the 1/2"

flange devices has to be heavier. You can't just
drop in different transistors, perform a test and
post your results like they are the last word.

Again, I don't doubt you obtained the results you
did. I just don't think your results constitute
grounds for the generalization that 1446s outperform
2290s in driver applications (or any application for
that matter).

When I had my base hooked up I used to hook a light bulb to the coax and watch it light up during storms. At that time I thought it was really neat. I can say I never got hit. I guess I was just plain lucky.

> PS - When that 'end' of the coax in that pickle jar starts

I have the antenna on my Jeep on the back left bumper as described in
another message in this newsgroup.

I also have the antenna on the trunk of my heavy Chevy. I see at least a 6db
front to back difference.

One day I was skipping to the west coast, when someone said they heard the UK.
I did a 180 in the parking lot, and talked to England.

I can also use it as a direction finder, although the peak/null isn't very prominent.

I have used the RatShack dual chain bumper mount. It did what it was supposed to do.

Never tried it, but I have heard that an injection of battery acid into his coax will apparently do the trick. The effect is slow as the isolator breaks down, but eventually his equipment will be damaged by a short.

or....

Write the offending CB'er a letter with a return address of somebody else in the neighborhood you don't like, and let them go at it. That way you can kill two birds with one stone !!

Joking aside, I think you are better off going to the FCC. Just make sure they keep you anonymous in case he comes looking for you after.

Maybe a petition by the rest of the affected neighbors could be in order. That way he can't single you out.

Richard.

cheap stereos, cheap tvs, cheap computers--dah put some filters
in-line. If you take the time to read the disclaimer written in the
back of every consumer appliance today, you will find a statement to the
effect that YOU, the owner of the cheap equipment, must live with the
interference caused by outside forces.

Here in jersey and I don't know where else there sold but there is a guy who
builds and antenna called tiny built. In many tests my self and friends
found that they receive better then Dave's antennas.
the are screwed together not welded so the power capability is limited to
about 7KW. This teamed up with Dave's mount or tiny's mount the same as
Dave's is the best thing for the price. $65.00 for the ant.

Quite. But there's nothing in there that says two parties cannot both find a reasonable solution to interference problems.
It takes a modicum of effort, and a little "good faith" gesturing, but it can be done, in fact has been done quite often.
The makers of that cheap crap ought to be strung up by their <insert whatever here> for being so cheap as to forego any semblance of shielding. But until they change that (fat chance) people ought to work it out themselves.
The guy that won't is a problem, plain and simple.

Dave,
For what it's worth. Mounting antennas on the driver's side minimizes the 'hits' the antenna will take from trees, etc, in town. Off-road, who knows if it will make that much difference.
There is some directivity by mounting antennas at the 'corners' of a vehicle. How much is also any body's guess, and Mine would be 'not much'. It's not like it will make a lot of difference, anyway.
It's always best to mount an antenna as high as you can on a vehicle. The more antenna 'shielded' by the vehicle body, the more 'wasted' power. You have to know when to quit though, otherwise, mount the thing on the roof. The key word here is, practical.
Make sure the bumper is grounded to the vehicle chassis, some aren't. If you have a 'spare tire' mount, you might think about putting the antenna there.
Since your going to be 'off-road', think about how to protect the coax from damage, mud/rocks/(?). Getting it inside the vehicle as soon as you can is one way of doing that. A 'skid-plate' is a bit rediculous, but an option.
If you plan on changing antennas for 'off-road' and normal(?) driving, forget the quick disconnect. Keep a wrench handy. Sooner or later you'll drag the quick-disconnect off along wioth the antenna.
Have fun... and good luck.
'Doc

Sure, the owner of the cheap equiptment must live with the interference, BUT NOT IF THIS MORON IS USING ILLEGAL AMOUNTS OF POWER!! (sometimes it's like talking to a brick wall with you people) Does it make sence at all that this guy can run 100's of watts then expect any equiptment that is interferred with to accept it? BTW- there's also a statement on the back of those devices that says that they can't cause undesired interference (and what is this guy doing with his huge radio?)

After reading all of these- I'd say go right to the FCC. He's using illegal power, so there's no reason that you even need to bother dealing with him. Let the FCC take care of him.

chassis, the
> 14's will outperform.

So you're talking stage gain. I don't agree.
The actual gain is close to equal. The
efficiency is not. The 1446s will show more
amplification with less drive when the power
supply can't hold the collector voltage up
on the pair of 2290s. In other words, the
1446s will look better when the power supply
(or associated wiring) is weak or the output
transformer is saturating under the increased
load of the 2290s.

Your scenario holds true when comparing 4-pill
amps (other than Texas Star), but not 2-pill
amps because any peaked radio can drive a pair
of 1446s or a pair of 2290s to gain compression.
If a pair of 1446s outperforms a pair of 2290s
it's because the DC supply to the 2290s was
dropping voltage somewhere along the way or the
output transformer is saturating when trying to
deal with the 2290s

Try your experiment again, but this time monitor
the collector voltage. You'll need to use chokes
and bypass caps to keep RF off of your voltmeter
leads. Pick a voltage (like 14) and make sure
the power supply maintains it no matter what.
When the collector voltage is held constant, and
the output transformer is not saturating under the
heavier load of the 1/2" flange transistors (2290s),
you'll find that at any drive level up to the 1446
gain compression threshold the output will be close
to equal. Then, you'll find that the 2290s saturates
after the 1446s and therefore outperforms it.

Your initial results are why I don't recommend
using 1/2" flange devices in amps that originally
used 3/8" flange devices. The output transformer
and associated DC board traces and DC supply wiring
are not heavy enough to support the less efficient
1/2" flange devices. The result is less than
satisfactory performance.

Here's a tip: Shunt feeding the DC to the 1/2"
flange devices (when trying to use them in a 3/8"
flange amp) reduces the load on the stock output
transformer and results in better performance because
the output transformer saturates at a higher output
level.

It's easy to talk. It's alot harder to back
up ones talk with scientific evidence.

> 123 tried using them with his
> amps and we all know what went down with them ...

I don't know what went down with them.

All I know is what I can back up with real
proof.

Don't get me wrong, I love 1446s. The best
straight (low-drive) daily-use 4-pills use
1446s. An excellent (and economical) kilowatt
PEP daily-use CB amp design is the one-driving-
eight using 1446s. I'm just not convinced that
the 1446 is a better device in a driver/modulator
application than the 2290.

I like the letter suggestion. Send a registered letter to the guy with a copy of the letter intended for the FCC. If he does not comply, send it. More than likely it will not do much good anyway at the present time. The replies coming from the FCC concerning non malicious or safety (Their words, not mine) interference complaints have been nothing more than a letter of acknowledgement and state they are not persuing these type complaints as of this time but they will retain your complaint in the event that they resume these type of investigations in the future. Situation sucks, but the recipient of the interference is more than likely to get no recourse through these channels.

I use a Wilson 1000 mag mount antenna..I have it installed on a 98 Dodge pickup in the middle of the roof. I have great luck with it myself and it holds up really well with my setup. Not quite stock radio and other acc's ;) However your mileage may vary!!

BTW Welcome back!!!!

:meant they take a few letters from there call and mix it with a few numbers for
:cb and KQR525 would be a great example of that

It would be legal to use your Ham call sign on the CB band. If you are running
a legal CB station - then it would be as good a call as any other.

: I thought you had to have a "BIG" radio to mess with other stuff
: in tha car?

Nope. All you need is rf currents on the coax, and the coax routed where the signal can cause the problems. There are a number of possible causes of the rf currents.

First, try re-routing the coax away from the radio, automotive computer and electronics that control your variable speed windshield wiper.

If that does not fix it, you may have either bad coax or a bad connector on the coax. Or, the antenna might be the problem.

Professor <bgriffey@kwom.com> wrote:
: So you're little 1pill is working... huh?

How would he know? I have talked to every state in the US, running a legal power base station on an omnidirectional antenna. I have also worked about 30 states using a legal mobile.

In other words, amps mean little, except you will be heard a bit louder or a bit longer than people running legal stations.

Professor <bgriffey@kwom.com> wrote:
: I agree... this is most unusual for a radio putting out only stock power.

If there are electronics that control a variable speed windshield wiper,
then even legal power can cause this to happen - if there are currents
on the outside of the coax.

I have only seen it once - and moving the coax away from the control box
solved the problem.

Probably from the Motorola handbook on RF devices. The same place that any
self respecting amp designer should start. Why spend all the time working
out the basic configuration, when it has been done and tested already?

> that matter).

This is not a matter of dropping in devices in test chassies, it's in production units both boards using 1/2" flange application, not 3/8", of course with different input and output transformer configurations.
Again, the 14's outperform 22's at lower drive levels...not by much, but they do. As drive increases however, the 14's saturate quickly whereas the 22's take off.
If you don't believe it, go get a Dave M80 with (2)22's and a Connex amp with (2)14's
and see for yourself.

Jerry, no matter where the guy puts his whip it will certainly work (within reason) , as for where other than being in the middle of top I think it really does not make that much difference, as for left/right placement, left is a bit better for overhanging limbs etc..

As for testing, there is a noticeable difference between mounting a Whip on the trunk or bumper as opposed to center of roof. This i do know from my experience with antennas and mobiles. I cannot say how much difference or even try to represent this statement with facts. All i can say is it is a noticeable difference....

Source record: 40420

I am running a Uniden PC-122 XL in my pickup with a roof mount Wilson 1000, and I am running off of the battery direct. The only interference that I get is when I turn on the windshield wipers. Every time the wiper goes across the windshield if comes over my cb speaker. I can turn up the squelch and squelch it out, but then I can't talk to anyone in the distance. Any ideas on how to eliminate this problem? Thanks, Rocketman

You must attack this noise at its source. You should try a 0.1uF ceramic capacitor across the power leads as close to the wiper motor as physically possible. This will have the effect of not only bypassing the noise on the power leads but keep the internal brush arcing to a minimum. Sounds like you may also benefit from a new wiper motor... the brushes are probably badly worn and arcing like hell.

hahah You need to try and justify that dave got his design from someone, since you guys are pirates in your own right .Let me ask you this which design did he get from them? he has had many different designs over the course of his career, different is meant as far as his combining techniques, transformer size, ferrite material, turns ratio, loading, layout etc So please tell me which one is it that he copied and provide some proof... Don't talk me a new asshole i already have one.Talk me some facts , so when you prove it i will prove you wrong with pictures of daves various design which were derived from experimenting .he is a rf engineer who can and does design electronics you are a assembler big difference. Can you tell me who he got his other designs from such as ac amplifiers , regulators? antenna mount? 1/2 wave antennas ?, digital reading watt meters, Which is it? you guys use them all so tell me Ohh great 827 the Pencil Pocket Protector dude.

May I defer to mr icecold nyc, he has seen first hand 10+ years ago when dave was cutting his teeth on dc amps you seem to forget dave worked in the broadcast industry building and maintaing bigger amps than you have ever seen...

Message-ID: <8iqejknsj1@nnrp03.primenet.com>
Source record: 40430

I just got a Magnum Deltaforce for my birthday. I like the radio, very good TX, it keys about 10 watts and swings to 30 out of the box. This thing has more audio than I can use in my Suburban. The problem I have is with the receive. It is comparable to the cobra 19 plus type radio. Heavy static and lots of bleedover.

I noticed this radio has a direct ground to the battery. No .01 caps separate the board from the chassis. The power input has a 4700 uf 16v capacitor across it and no chokes. That appears to be it. I wonder what would happen if I did this to the Deltaforce? I did the "Improved AGC and Selectivity Modification" outlined in the www.cbtricks.com website. This has helped. What I need is a mod for the Noise Blanker circuit or a better circuit.

Any ideas?

>I guess most of you are to busy shitting on each other
>with witty comments and accusations to find a minute
>to help out a newbie to the group with a butthead Rat Shack
>question.

Your set up is fine as it is, there should be no need (if you set it up properly, which I'm sure you did) to try for any extra 'highway send' or receive.
On the road, extra power in the form of an amplifier for transmitting or preamp for receiving can often be a hindrance in an emergency situation, particularly if the amp is not matched well with your system and causes more noise or an indecipherable signal... not to mention the transmit amplifier is illegal anyway (just a point to ponder).
As far as your mildly 'I've been snubbed' attitude, what often happens in a newsgroup such as this (besides the b.s. that you rightly mentioned) is that 'newbie' questions don't get answered in a timely fashion, as most 'old hat' groupies may assume someone else will answer the question. That question is often one that has been asked (and replied to!) many times before, and new 'members' to the group should go to the FAQ of the group to see if they can get their query answered before posting a redundant question.
It's not that anyone's trying to shun new people, just the nature of a large, disparate newsgroup.
Don't let it make you stay away from the group, though, this is a great place when you get used to the "nettiquette". :-)

I bought a 12V car fan. It had no noise suppression, and came thru my CB, stereo and scanner at 857 MHz! Put a ceramic disk and a torroid inductor from a power supply at the motor. That reduced it to tolerable levels. To almost completely remove it, I had to put 8 turns of the power wire around a snap together torroid. Now I'm cool and quiet. YMMV.

The professor is right in that you must put the filter cap AT the motor. Any distance away, and the noise will radiate from the wire.

How much is a "little"? You can squeeze a few more watts out of just about any cb that is stock. Someone recently gave me a 35 watt booster. I hate to call it a linear. It is actually a joke. It is smaller than a cigarette pack and the gent said he bought it from D & R electronics in Ontario, Cal. for something like 20 bucks. My trial and errors with it found that it does work, but only with certain stock radios. It actually suppresses the audio on certain radios.

Maybe the Gulf on one side and the Atlantic on the other has much to do with it, but many stations in the 'pile have made all 50 states this sun cycle BAREFOOT. Last night alone we had conditions from the Gulf states all the way to Washington state. As I stated, park on the beach and you can get across the Atlantic no problem when the DX is running from a mobile, also barefoot. On several occasions I have hit the UK from my truck with a barefoot 77 (no amp) driving down the big road a few miles in from the coast. Do not know how the rest of the country is faring this cycle, but this is not an exception here in Dixie, rather it has been the norm as of late.

man i sware this guy said one time on here that he was driving trucks
and then i got the impression that he wanted to go to work at xforce
building amps as soon as they got on line, now he talks about being
formally educated in radio frequency applications, give me a break,
really. son, i can read between the lines 827 , i mean after being in
this business for about twenty years give me that much credit. you
chicago boys need to get your stories straight. and you know dingo ,
you are right, they did steal their design from a man in jersey , and
827 is nothing more than a $8.00 / hour board stuffer for xforce and
then this punk has the audacity to scribble his stupid handle on the
damn amp, boy that makes me want to puke my guts out,.....cd is out....

==========
Sorry Bill your comprehension skills are not too sharp. I never used the
word "only,all,most"
I will quote 2 different statements from me regarding variables and
competition amps,
something you don't know much about. So regarding competition dc amps the
"norm"for amps with
variables is they have a driver stage and they drive your keying "final" amp
(2,4,8,12,16). Of course they can be ran
alone but are regarded as drivers...

1)--"> Bill the amps that have driver stages in them are the only ones with
> variables..."
2)-"Bill the drivers are the ones that have variables on them ..it is not a
common thing on competition amps
just the driver.

>
> > yes, you can use the "driver" amp as stand alone amp that is not even in
> > question
>
> Then it's not a "driver" is it?
==========
just because it has multiple uses that changes its name? I have a 3x3000a7
,driven by 3-3/500z tubes , predriven by a 1x2 pill amp. The 500z's are the
driver for the 3000. Does that mean
when i run the 500z's alone it is no longer my driver amp and now the 1x2
must be refered to as my
driver? What ever play on words fits you Bill

>
> What's in question is irrelevant. What seems

i have a superstar 3900 , good radio . got mine used in good condition .

it swings good , good # of channels , real good audio .

but galaxy's are good too , lot of people swear buy those .i have never had one though .

there is only one thing i don't like about it , it drifts a lil bit in extream cold and heat . but thats what a clairifier is for .

#1)Does #12 know Dave personally??
thats ok i'll answer for you NO! Has he ever spoken to him?
I'll also answer that for you NO! So other than heresay how would he know
where dave got anything ?

#2)I guess that means the current line of xforce base amps that bears the
#12 for him designing
is daves design and not his. I mean it is a davemade amp with lass b bias,
which is only a few diodes
resistors and a few caps

---

when 123 worked on x-forces they were a dave copy . but since then they have
made a # of changes 123 was not a amp designer , just a builder . the current
x-force man is very good in design , and has very reciently made a change in
the smaller boxs . which i got one of the first , and love it .

i don't know what the differences are , i never ever touch any of my amps .
looks like spagetti to me . never seen a dave made . but i can relay that #12
told me that if yu were to compare the current line of x-force's and the
current dave-made there are a # of differences

Must live with the interference caused by PROPERLY maintained, installed and
operated transmitting equipment. If the neighbor is freebanding and running
power, part 15 has nothing to do with the situation.

I think the 3900 is a nice unit, I have owned several, still have one. I did the rx and nb upgrades, heavier regulator, variable power, 10k, tb, long and short rb, and de-notched the clarifier...on the other hand....if you don't need the ssb, the 55 is a dynamite radio for the buck. Bottom line is do you want ssb.

I'm just not convinced that
> the 1446 is a better device in a driver/modulator
> application than the 2290.

The testing I did and do always supplies ample voltage, amperage, and carrier wire to supply units being tested. The pair of 1446's in the SAME CHASSIS DESIGN did outperform 2290's with typical radio drive. As to the comment of a radio can drive each equally into saturation or full output is crap. A pair of 2290's will take up to as much as 90w pep before saturation, wheras a pair of 14's will saturate at half that. Hence the reason that a pair of 14's will outperform the 22's at typical radio drive (30w pep). It's not by much, but they do perform better. The 22's show about 90-100 and the 14's about 110-120 on the Bird 43. Just because you haven't tried it, doesn't make it untrue.

Most guys don't put the antenna on the roll cage because the top won't fit anymore. Your roll cage should provide an excellent ground plane though, so press on. You *must* trim the antenna properly after installation to get a good SWR reading. The FireStick II has a trim adjustment built in that works great.

A magnet mount antenna does have a ground, it is capacitively coupled to the
mounting surface. This changes the match. If you take a Wilson 1000 on a
trunk mount, and put it on a magnet mount on the trunk, you will have to
retune the antenna. Magnet mount grounds don't handle much power. A properly
grounded antenna will always outperform the magnet mount. A larger antenna
is better then a small antenna.

Top! Real Jeepers don't have tops! I run around with the Mopar three piece set, and put a tarp over it when it rains.

I have my antenna on the bumper now and it works real good in one direction. I was wondering if anybody had tried it or has an antenna mounted there.

Thanks for answering.

Question1: What is copper's catalog used for?
Answer1: To promote and sell their product!

Question2: If they have something for sale do you think they will hide it from you?
Answer2: No they will be throwing it in your face trying to sell it.

Question3: If you were to buy a car would you pay to walk around the lot browsing?
Answer3: If you would, Buy the damn catalog.

You're talking about Mark Fuller. He publicly disagreed with Dennis #12 about the sale and use of high powered amplifiers on the newsgroup. The debate became rather heated over time. Dennis encouraged the posting of Mark's home address and suggested that people harass him. Mark responded by contacting Dennis' employer and informing him that Dennis was using company internet connections on company time to dispense advice regarding illegal CB practices.

Mark dropped out of CB, passed th bar, and got a life.
Dennis (some say) is still lurking in the shadows, plying his (illegal) trade.

My brother mounted his antenna to the tire stopper thingie for the swing out carrier. He put a 5' FireStick and 3' FireStick. Both work pretty well, but he is not able to adjust the SWR (no meter to measure it with) so he has some trouble with directional stability. I use a 3' FireStick mounted to the top of the spare tire carrier (a Canyon City model) and it goes about 6 to 9 inches above the roll cage and it works well in every direction. I have a built in SWR meter on my radio, and it helps to trim the antenna.

>what exactally does the rx upgrade do . and the heavier regulator .

Check out Panther electronics, you can find out there more specifically.
The 3600 chassis isn't that great on rx, but by swapping 2 diodes and a tx'r, then a rx alignment, it makes a huge diff.
The stock regulator in the 3600 chassies and others are inferior and heat excessively after radio has been tuned for peak performance, replacing it with a 12a reg adds to longevity and performance (kinda like running 14ga wire to a 400w amp).

What I think he means, is that WebTV is kind of a pathetic idea to begin with (using your TV to surf the internet? Just go buy a $100 used computer, it'd be cheaper AND you'd be able to use the computer for other things as well). Once you've worked with computers for awhile, you begin to attain a certain vengance against "idiot-proof" computers (idiot proof computers are like those ones with color coded cables, and a little backup CD in case you mess it up. Unfortunately, those machines make it impossible for someone who knows what they're doing to do anything. Personally I think they should be illegal).

6855. Re: What drive is required for the 3CX3000 A7 ????

Newsgroup: rec.radio.cb
Date: 2000-06-21 00:00:00 UTC
From: Sunshine <sun@shine.com>
Message-ID: <TWa45.84$6J5.13860@news2.voicenet.com>
Source record: 40628

For mobile keydown operation
1000-1500 watts of drive would be adequate so if you wanted to run an a
driver 2-3-500z tubes loafing easily would be a good driver, if you wanted
to run a dc amp into it
a 8 pill on 15 volts will give you about the amount of drive you need.

1-250 amp alternator will run the 3000 to full output

you will see 8-15 kw in full keydown mode depending on how the amp is
constructed,
quality of parts used, etc.OF COURSE THIS WOULD ALWAYS BE TESTED INTO A
DUMMY LOAD sine that many watts is illegal

On a base expect to run a a seperate 220 line with at least a good size
breaker. 8 kw would be
what is expected. A 2-4 tube 250b base amp would be a great driver....

Source record: 40629

mickey,
Basically, you use a step-up transformer to half the
required voltage(half the current), use a voltage doubler
rectifier to get the desired voltage. To get the required
current, the transformer is quite large.
Or, for transistor amplifiers, 12 volts at fairly high
current isn't really to difficult. The transformer is quite
large, or you use a 'switching' power supply.
Besides, amperes are larger in the US...

Abe Brewer (the brains behind Varmint) got his inspiration for
a solid-state amp design from the Motorola RF Device Data Book.
Take a look at page 8 in CB Tricks II. A 1976 schematic for
his 100 and 150 model solid-state amps is there. Right below
it is an early west coast design. Both are crude, but Abe's
is worse than the one below it. No feedback. No base shunt
resistance. No input swamping. My guess is that it's lucky if
it worked decently (without noticable instability and overdrive
related symptoms) in 50% of the applications.

If that's where Dave got his start--it certainly wasn't much
of a start--and he deserves all the credit for what he's turned
it into.

You need to understand the concept of amplification before
the explination will mean anything to you.

If you understood the concept of amplification you wouldn't
be asking this question.

So, here we go 'round-and-'round.

In the US every address is supplied with 220 VAC. The difference is that it's purposely split into two 110 volt legs that work with a grounded return line (called the "neutral"). If we want 220 for an amp we combine the two legs and the neutral becomes a separate ground (the third wire).

In the US, large electric appliances (like electric ovens and clothes dryers) run directly off of the incoming 220 VAC. It's not hard to tap that for amplifier use.

That's pretty close.

The biggest inaccuracy in your story is that Dennis
plys an illegal trade.

Firstly, Dennis still works for Lucent (a legal
corporation).

Secondly, Dennis still repairs amplifiers (the
repair of existing amplifiers is legal).

First, you kept emphasizing your statement that your test
used the same chassis. Now, you sight a comparison of a
Dave amp and a Connex amp (BTW I've never heard of a Connex
amp). The farther we go the more convoluted your test set-
up and results become.

I don't want to sound like all I'm trying to do is beat you
down. If your test results show 14s beating 22s, and you
see your test results as comprehensive, by all means bask
in the light of your new-found information.

Agree there. I have a computer alright, old as the hills before they became affordable for home. Never touch it. Threw this in line for half the price of a decent upgrade for the kid's schoolwork and hooked it up to a small TV we do not use and never touched it for close to 5 months until someone told me about some wholesale electronics on the web. Radio related items is all I use it for, but it works for me.

6876. FS: Realistic TRC-449 SSB CB

I have a Realistic TRC-449 SSB CB radio with the PLL that
is the easiest to mod and add extra channels, etc. Radio
was bought new but only used for one weekend. Been in storage ever
since in it's original box. Great for collectors or moders.

Radio was never touched in side so you can do the mods right yourself.

Selling for $175.

No trades please will ship to anyplace in the US or canada
and price in US funds NOT canadian.

I lost the post about the MFJ small tuners not handling 300 watts AM, so perhaps you will see this. I have a Kenwood AT-230 in great shape, not a scrach on the face, not a ding on the cover. It will handle 300 watts continous wave (CW), the 300 watts AM would not be any problem for it what ever. reply to this email address

He doesn't show a courtesy to you so I would not have a problem in asking the FCC to send you the information that you can take to the Sherrif or to the police dept to shut him down. It is a violation to run more than 4watts input the the finals. Nail him and anybody else you get crap from. I can run 1500 hundred clean watts of power and bother NO ONE in my neighborhood or my house for that matter, except one time on a $4.95 telephone that I found a nice home for in the trash can. :o)

To start let me tell you one thing, you don't need to buy all of those gadget's in a radio when you can buy say a Galaxy 88 or something close to it and just PUMP it up to get Max performance. The Wilson 1000 or 5000 magnet mount is very good. Maybe you should take alook at a homemade 5pill like a Dave Made Or NONAME or something with at least a 1 2290 driving 4 2879's or something. But it's up to you to decide on what you want. But let me tell you my way would be way cheaper..ALOHA From The 50th State. $$$BIG MONEY$$$ In The Grass Got Down

Butch, if you are running 1500 clean watts without bothering any neighbors(I am assuming you have close neighbors) what kind of amp are you running? Can disregard question if you are referring to HF freqs.

Butch,

If you don't get any free ones, you can get one at the local Radio Shack
for 15-17 bucks, which is pretty reasonable.

Hey everybody, im new to the group but i've been into CB and general radio communication since I was about 5.. I'm 15 now and I live in New Hampshire, I use to live in Littleton Colorado where I had a Realistic TRC 501 basestation running a full 4 watts.. I couldn't really get out and soon lost interest because I always heard so many interesting people talking from all over, but even under the ideal conditions I could never talk back.. So now im starting to get back into CB's but this time im going to get something with more power and features... Im getting a car soon so it's going to be mobile... Here's what im thinking of so far, tell me what you think about my setup..

Radio:
RCI 2950-EX $259.99

with the following mods.

Ranger echo/reverb/speech processor $75.00
talkback $10.00
Open Clarifier Mod $15.00
Channel Guard $65.00
Improved RF Gain Control $15.00
K Beep Installed $30.00
Peaked and Tuned $20.00
Turbo Tuned $50.00

Microphone:
Astatic 575M6 42.99

Antenna:
Wilson 5000 magnet mount $99.00

Amp:
Elite 600HD
1x1446/4x1446s 3 stage $299.00

So would this be good?? would I get out??

6910. Re: What do you think about this setup?

Newsgroup: rec.radio.cb
Date: 2000-06-22 00:00:00 UTC
From: rgray@kc.rr.com
Message-ID: <Tff45.26803$m5.6951@typhoon.kc.rr.com>
Source record: 40683

I own a 2950 EX and love it...however after spending all that money on the 2950 (all the extras you listed) you could very well get a real radio like a Yaseu or Kenwood radio...that way if/when you upgrade to a ham operator you will have more than a glorified CB radio....again I LOVE my 2950..but I really would love to have a Yaseu 757 or something like that...appx 100 watts output...speech processor and lots of extras. Also I am pretty sure were you got those prices. Was it www.exportradios.com ??? That is were I bought my 2950 EX HD with a Palomar Magnum 4500 amp and a wilson 1000. I LOVE this company and still do buy from them, however I think that you can do better on the price of the Wilson 5000 antenna than there. Also I really would suggest the palomar magnum amp in place of the 600HD. Same money anbd I get 500 watt output from mine on SSB. Also all of those noise toys are not really like on the SSB part of the radio. Distracting and ugly in my book. I even turn off my roger beep (if I remember to anyways) on my 2950 when I am on SSB...which I operate 95% of the time.

The choice is a good one..and I am not knocking it...just one consumers thoughts.

If you want a "toy" radio that has alot of those features you want and at alot cheaper price then I would get a galaxy 959 or something along that line.

On another note I bought the D104M6C and it is in the back seat of my pickup not being used. I found out that I really did not need it and the DX stations said I sounded better with out it. And No I did not run it to the max...tried all settings and the stock mic worked better with the rig FOR me that is!!

Good luck in your quest for there are alot of choices out the...just find one YOU like and features you CANNOT live without then go from there!!

Peace

Ron

Very simply go to rat shack and get remote for a remote control car that operates on 27.145! When you turn this thing on it emits a signal that is very nasty! Take note tak the antenna off remote and add a wire about 18' long! Now throw the turned on unit into a bush at the shitheads home 20. If you can try and strech out the wire get it as close to the antenna a you can! This thig will blead many channels it has worked for me in the past! Make sure you put the remote in a plastic bag! You can also hook up to solar 9volt leave it on all the time!

Sent via Deja.com http://www.deja.com/
Before you buy.

6912. Sweet 16 hook-up ???/

Newsgroup: rec.radio.cb
Date: 2000-06-22 00:00:00 UTC
From: rgray@kc.rr.com
Message-ID: <urf45.26806$m5.6951@typhoon.kc.rr.com>
Source record: 40685

I bought a used sweet 16 and the guy had revamped it. He took out the fuse and all of the remote jacks in the back and installed different power wires on it. Of course I have no info on this amp. Here is my setup.

2950 EX HD into a palomar magnum 4500 into the sweet sixteen. The sweet sixteen is being feed with #2 welding cable from the hot side of the battery and same size wire grounded to the frame close to the amp. I am not sure that he has the power wires hooked up correctly. Looking inside the amp the +12 volt wire is hooked up closest to the back of the radio. I did take a picture of it with my digital camera so if anyone wants to look at it I really would like to send the pictures to them. Right now when I am putting appox. 100 watts into the DX1600 and turn on the bigger amp the watt metter shows less watts than the driver amp is putting out, with the DX 1600 off then it shows around 100 watts with the palomar on. REALLY would like some input here.

Thanks

Ron

6913. Re: What do you think about this setup?

>1x1446/4x1446s 3 stage $299.00

That system has one weakness, the Elite 600HD. They are total crap amplifiers. If you're purchasing from Express Electronics (which it seems you are), you may ask if they can get you an X-Force X200 in the small case with SSB delay. That will give you about 500 watts with much higher stability and less money.

Your radio setup you described is going to cost a chunk of money, you may be better served with a Magnum Delta Force converted and tuned with a D-104 mike. If you like, you could add the Channel Guard and K-beep, everything else is in the radio, and you'll save yourself about $150.

Connex units are built by 123 and Sledgehammer. They use a very similar board to the Dave X80, both utilizing 1/2" flange holes and 1" transformers. Buy the two units and see for yourself.

REALLY would like some input here.

****
Rule 1. NEVER dead key more than 30 watts, usually 20 is more than sufficient. I can key in 4 watts and still have a barefoot radio drive the 1600 to 600 watts by itself. A TS Mod V is perfect driver, no more than a TS 250HDV is ever needed.
It sounds like the unit has been overdriven if it is showing less watts, or it is showing reverse(reflected watts) key. Drop the carrier to 150 to 200 on the 1600 and see if it swings up over 1200 or so on modulation.

Ok...sorry I guess I did not make myself clear here. I DO NOT drive it with more than a 80 to 100 watts of dead key....and I have tried to drive it with my 2950 and still no luck....he said he replaced the pills in it and it looks it...and he also said that it was kicking around 1400 watts on the bench. He is being pretty decent about it...and said he will fix it or make it right to me!!!

Thanks to all.....

Running a little power is a option.
I still have a mobile 200 watt unit someplace.
A 1011d, a large Palamar base amp. 751 Icom
and 3-4 of those Texas stars/Galaxy mobile radios
I think I tuned those units to about 6-8 watts AM/ 20-25
SSB.

I'm going to Copper's site & check with my local
dealer if we have one????? (Charlotte,N.C. area)

Reply to newsgroup or d.fell@excite.com

6922. THE BEST SKIP STATION EVER.....

Newsgroup: rec.radio.cb
Date: 2000-06-22 00:00:00 UTC
From: Derek Fell <tim@mindspring.net>
Message-ID: <p2groq8ec7b9aaidofraerfl45asam6h9h@4ax.com>
Source record: 40695

I have been away from 11 meters for a while, this internet thing
hasn't help my interest either...

Early 1980's the best skip station I ever heard had to be:::
Tequila5 From Acapulco, Mexico....

Living in CLT,N.C. We would hear skip coming from FLA,
making the swing from TX & into CA. The whole time
you would Tequila 5 from Mexico talking.
When CA & all the skip was going down you could still
hear him talking in the back ground.. I had made many
contacts with him, he was often asked about his rig.
A radio shack ssb & 5/8 ground wave Ant. All stock!!
I think not, I feel he was sitting on top of 1 large mountain
(many in MX) using a 6-12 element beam & about 2 kilo's.

To hear a station hang in there for many hours, when
everybody else goes away and Tequila 5 is still there
it has the power of a midsize AM radio station.

Just a thought, how about yours?????

Derek

IMO, THAT SIMPLE SETUP WOULD BE A LOT OF FUN.
All that x-tra is nice, but you won't be the loudest unit on the freq.
A 15 yr. girl friend is a lot more fun....

Keeping it real.....

Have you asked anyone else in the neighbourhood whether they are
having trouble? It may be just your gear. Also with that attitude, I
would like some neighbourhood support before I did _any_ of the
suggested responses.

Grab a deltaforce, you will like it, i run 2950, deltaforce and a few ham rigs, i definately like my Deltaforce, Nothing wrong with the 2950, just that you'll be cheaper to get the Deltaforce........

As for an amp, my opinion is get a Texas Star to start with, good little amps, but if you care to venture into the Competition box's get yourself a Xforce, that is set up for SSB....

The fact that it will not work of a radio tells me that it is changed
dramatically. It should never get more that 30 watts dead keyed into it from
any source at stck design. I don't see how anyone got 1400 out of it if it
won't accept key from the 80-100 that you attempted to key in it. I would just
return it if possible as it has serious problems. It obviously isn't what you
thought you were getting.

Of course they use a similiar board as daves thats all 123 knows, And thats why 123 and sledge are relugated to making trucker amps they cant compete with the real manufacturers. And need to sell a cheaper version, sledgehammer uses cheap surplus parts and cheap transistors

Last night I talked to some friends in Arkansas from here in the 'pile from 10:30 pm to almost midnight when I signed off. One was in Marmaduke, one in Rector, and one SE of Jonesboro. The one in Marmaduke stayed close to S9 even while the other signals began to fade. All were barefoot stations. Location has a lot to do with it, as you suggested elevation such as a mountain top. But propagation does appear to defy pleny of logic. One particular episode that sticks out in my mind is a station from Ulverston, Tasmania came booming in here one night among a bunch of us locals just shooting the breeze on lower 38. We were all barefoot and each one of us were able to tag him. Conditions were so strong and the channel so quiet, we decided to do some experimenting. We were all on omni directionals but he was on an 8 elemant yagi pointed east on the flat side running 100 watts. He went to vertical and he heard none of us and we could not hear him. Came back on the flat side and he then turned his beam west. Guess what happened? We still heard him, but his signal was about nill. His audio carried him through. Assuming he was telling the truth, it would appear he had conditions to work us from east and west. Strange, but I have heard about stranger things even still.

6959. Still looking for schematic/manual for a Pace 1000M

Newsgroup: rec.radio.cb
Date: 2000-06-22 00:00:00 UTC
From: WB3KUM/9 <d.breeden@NOSPAMwcom.com>
Message-ID: <395235A0.7711F788@NOSPAMwcom.com>
Source record: 40732

I am still looking for a schematic/manual for a Pace 1000M 23 channel, AM/SSB CB. Someone did get back to but has not folowed through yet.

I would be happy to get a-

Factory schematic/manual
Copy of the factory schematic/manual
SAMS (or equiv.) schematic/manual
A copy of a SAMS (or equiv.) schematic/manual
The SAMS packet number that contains the schematic/manual for this unit.

A source to obtain this, ie. hi-manuals for old radios. (I have delt with Ray Sarrio and he does not carry this but is excellent to deal with.)

If you are selling or require the reimburstment for copying and mailing, please let me know in advance of these cost so I may pay upfront.

Many thanks in advanced.

REMOVE NO SPAM invalid FROM E-MAIL ADDRESS.

Optionally, consider asking an attorney to send him a letter stating that your position, you would be amazed what the threat of legal litigation may have even if it's beyond court jurisdiction. I would also consult with your local city attorney inquiring whether there may be some recourse there. Either way it will inform the proper civil authorities of the situation and document any actions you've taken.

I was using some very large wire nuts. Now I use forklift battery disconnects.
I got them at Grainger, stock # 6W057. $9.55 each. I have two vehicles, and
one good radio/amp setup that I swap back and forth. This also makes it easy
to toss it in the trunk, out of sight.

If your 667 is stock, wire nuts are fine. If you bypass the fuses, upgrade the
feed wire, and upgrade the grounds in the amp, get the disconnects. The ones
I mentioned are good for 120 amps at 600 volts and are for 4 gauge wire.

Galaxy DX44 or Galaxy/Mirage 44 will provide the features you want at the
lowest price among Galaxy/Superstar radios.

> setup..
>
> Radio:
> RCI 2950-EX $259.99

I would go with the new 2950DX. $250 from AES.
Improved receiver, green backlight, and many
of the little 2950 problems solved or improved.

> with the following mods.
> ------------------------
> Ranger echo/reverb/speech processor $75.00

Forget this and save $75--it's not
needed.

> talkback $10.00

Without the echo/reverb you won't
need talkback. Save another $10.

> Open Clarifier Mod $15.00

This mod is worthwhile. Mention
that you only want the clarifier
unlocked--leave its tuning range
stock so the control isn't so
touchy and the radio doesn't drift
so much.

> Channel Guard $65.00

Not worth it. The DX model has an
improved receiver. Save $65.

> Improved RF Gain Control $15.00

The RF gain control mod simply
moves the compressed portion to
another part of the control
rotation. It doesn't really
improve anything so don't do
it. Save $15.

> K Beep Installed $30.00

2950s have a one tone roger beep
stock. That's really all you need
(if that). Save $30.

> Peaked and Tuned $20.00

This is worthwhile. Ask for a dead-key
range of 2 to 10 watts and expect a peak
output of 30.

> Turbo Tuned $50.00

"Turbo" mods are too extreme and unneccessary
when you have an amp. Save $50.

> Microphone:
> Astatic 575M6 42.99

A good choice in a low noise environment.
On the other hand, when the radio is tuned
up, you really don't need a power mic.
Also, there's still a question as to what
kind of a car you're going to get. The
stock mic or a good noise cancelling mic
is a better choice in a Jeep, pick-up, van,
or a car with noisy exhaust. Good noise
cancelling mics are the Turner RK56, the
Astatic 636L, and the Astatic Road Devil.

> Antenna:
> Wilson 5000 magnet mount $99.00

A decent choice. I suggest actually mounting
it to the vehicle to get a solid ground at
the mount when running an amp.

> Amp:
> Elite 600HD
> 1x1446/4x1446s 3 stage $299.00

A poor choice. The Elite line of amps is
unstable--especially when driven by an
export or 10 meter rig. And the ones
with driver stages are the worst of the
bunch.

There are many better choices of amp.
I like the idea of a 4 device amp with
a tuned up 2950. The radio has enough
power to run 4 devices directly, so
forget the driver stage (unless you're
going with a competition amp).

For your application I recommend the
Texas Star DX500R (4 X 2879) or the
Blue Face (Cobra/Galaxy/Magnum) 450
(4 X 454). You want B or AB biasing
for SSB, and good stability--especially
with a mag-mount. Stay away from the
Class C amps and the cheapies. I really
don't recommend a comp amp either. In
those they take the approach that you
have to get the most power from the
fewest devices. That's the proper
approach for competition, but not for
maximum reliability in daily use. In
daily use there are no rules. For
example, if you want 500 watts, you
can get it comfortably from 4 devices
(the regular amp approach) rather than
forcing 2 to do it by pushing them with
a one device driver stage (the competition
amp approach). Also, comp amps come
Class C with no SSB delay (they are designed
for AM-only service). So, adding bias and
a switchable SSB delay will make yours a
"custom" amp that you'll have to pay more
for and wait longer to receive.

> So would this be good?? would I get out??

Your original system was going to cost
$981 plus shipping and may not work at
all because of the squirelly amp.

The system with my changes will cost
about $727 plus shipping and will definitely
work.

I hope this helps.

Message-ID: <39525E36.3CC395A0@freewwweb.com>
Source record: 40765

It sounds like the guy is a good enough tech to check it out for
you and get it running. He'll just have to bring some of his test
bench equipment out to your vehicle and perform some tests. I would
start with DC supply tests. Is there voltage on the transistor
collectors? Does the amp key up (does the big TX relay pull in)?
With the amp unkeyed but powered up, is there any DC voltage on
the bases of any of the transistors? Key the amp with no input
signal (ground the anode side of the diode that's across the TX
relay coil) and measure the base bias on all the transistors. Is
it no higher than about .64 volts and equal on all the transistors?
Key the amp and feed it a small contant input signal (a carrier).
Does the amp draw DC current? Does the DC current draw increase
proportionally to the amount of input drive power? Does the input
signal show up at the primaries of the input transformers? Does
an amplified version show up at the secondaries of the output
transformers? Are any of the base to ground resistors burnt?
Are any of the combiner resistors burnt? Are any of the small
voltage divider bias resistors burnt?

All this sounds like alot, but it'll take a good tech less time
to do it than it did for me to type it. If your guy can't figure
it out, with the aid of your digital camera I might be able to
help. Feel free to e-mail me.

> watts or what?

That depends on the model, but the regular rules
apply to Messenger: with the 2-pills--2 watts for
loud punchy audio, 4 watts for a big carrier and
weaker sounding audio. Double those figures for
4-pills, and use the 2-pill figures for the larger
amps with driver stages.

You can go to a home improvement center and get parallel wire splices.
You can go to a high end car stereo store and get butt splices. I prefer the ones with set screws so you can take them apart later.
You can get the fork lift plugs that work well. Auto parts stores that carry electric winches have these plugs also.
They all work well for this application.

Randy

I personally don't run Dave's amps, but have spent some time on the phone in the past. I also have an 8 pill that he and 333 built together back in 1985 that is still a good clean design that is hard to beat to this day, I have to give the man credit.

HE DOESNT?
He is noted for doing work for xforce, and they are not afraid to admit it... they have even named the base amps after him ... maybe you missed that one..

bingo, resemblance maybe, copy no way , thats the only thing that may be comparable between his amps and varmint , but then again those same ferrite beads are used in the 2 kw Plasma generators made by RF Power of NJ.

Peekaboo you have no axe to grind so i know you would tell it like it is you are a competittor and no doubt would want to leave 'em slobbering in the mic... Dave has helped the sport 10 fold compared to what they have done the only thing they have done is to hurt it t and its the guys who don't know jack shit other than being xerox machines who try to bad dog him for there own gain

So you have one wire comming out the amp (1g) and a 4g wire comming from the battery, and you want to hook them together? Are you sure that it's 4 gauge running from the batt? We have 4 gauge wire running to power our whole house!! The only way I know of to connect wire that big is with those big clamp things.

ICEMAN RRC wrote:

Wind some of the 10ga around the 4ga tightly for a mechanical connection
, then solder and tape. Use heatshrink tubing and it'll look great.

If you have number 4 running to your house then you only have a 100 amp service...Really with a 100 amp service you should have number 3 coming in. This is per N.E.C. and has been like that for many years :)

Ok the Teaxs Star tech page says that the 667 pull 62 amps. There is duty cycle and such rot that is involved but I would up the wires coming out of the back of the amp to at least #8 and 6 would be better. If for nothing else than to lessen voltage drop. (another complete and drawn out subject)

Not an expert on amps at all.. However been in the electricial field for 27 some years :)

DingoWarrior,
Of course it depends on the application, but, since the
question was asked here, you can assume what that application
will be. Out of three choices, only one of those is a suitable
application.

This is a quote from the book "RF Power Design Techniques" by Irving M. Gottlieb

"In general, length is an important physical dimension of transmission lines. Although VSWR will not change as the length of a lossless line is varied, the impedance seen at the sending end of such a line undergoes change, except with the notable exception of a flat line - a line properly matched at its load end so that no standing waves exist along the lengh of the line."

In other words... stop trying to reduce your SWR by varying the line length!

7041. HR2510 chipswitch advice

Newsgroup: rec.radio.cb
Date: 2000-06-22 00:00:00 UTC
From: pbarker <NOSPAMpbarker@mail.coos.or.us.NOSPAM>
Message-ID: <56q4ls82e9on622a8p5sb6mu9v5lf8psri@4ax.com>
Source record: 40864

Hello,
I recently installed a chipswitch in my 2510 and everything works
except TX. Err3 is on display during TX when frequency is like
this: 2x.000. 0 but if i step up to 2x.000.3 TX works okay

Do I need to check the voltage regulator (7808) or do I need to adjust
the vco/pll circuiits?

Thanks in advance for your comments.
Phil

NO, he doesn't, he added his own design on a bias circuit to the box...
This is my understanding of the matter, from what i know he simply attempts
to improve on the existing designs.. I'm sure he has the ability.....

KW

I'm sure someone will correct me if i'm mistaken...

>what is expected. A 2-4 tube 250b base amp would be a great driver....
>

Well, it all depends.

If you are using a Class B or Class AB amplifier, it will drive to full power output (about 8 to 10 thousand watts) with 4 to 700 watts PEP of drive.

If you are running competition, Class C, it would take more like 2Kw input.

However, this guy is a dolt thinking that he can get full power output with one alternator...

250X18 volts = 4500 watts of input... That is about 3800 watts output.

So, you see, it takes a WEE bit more than a single alternator to get full out.

Pretty much. Make sure you have a good ground, though. You also might
want to check the antenna's SWR.

Professor,
I really hate to tell you this, because I agree with
your intent. But, your quote doesn't say what you think
it says. For instance, where you you find 'lossless' line?
You were right in quoting the part about if you match
impedances at the antenna end of the feed line, the SWR
will be the characteristic impedance of the feed line, which
should be the impedance of the transmitter input, which
would make the SWR very low... Who cares how long the feed
line is?

I was kinda worried about that.....but it doesn't stick out past the wheel flare. I think that if I am that close to something to get that "tab" torn off, then I will get tons of damage elsewhere.

None the less.....I will keep an eye on it. :)

Thanks

My worst radio ever was a 2950... (I've had bad luck with them. I know others swear by them and had good luck with them, but not me...)
I ended up giving one of my 2950's to one of my many girlfriends, and I had more fun with her that night than I could have ever had in a lifetime putting up and dealing with the 2950... The rest of my 2950's (I have 3 other ones..) are just sitting in the closet awaiting their fate...

I currently use a Cobra 148GTL I've had since 1977... And a Cobra 2000 from 1987 I rarely pull out.....

Not sure where you got that info... If you actually read the NEC, you'll see under 'Service Entrance Conductors' that #4AWG Copper is spec'd for a 100 amp service... and THAT bit of the NEC has been the same for a LONG time. DON'T look under wire ampacity tables... wrong tables for service entrance conductors. Check it out on-line at
http://www.codecheck.com/eleccode.htm#anchor1217577

> Ok the Teaxs Star tech page says that the 667 pull 62 amps. There is duty

DUTY CYCLE?....If running AM and the amp pulls 62 amps, it'll pull 62 amps till unkeyed.... I'd run #6 (at least) to be safe. (using the wire ampacity tables...)
check here for those as spec'd by NEC...
http://www.okonite.com/engineering/nec-ampacity-tables.html

If changing your coax length changed your SWR it is because your coax is radiating a good part of your signal (an UNDESIRABLE condition... after all, isn't it the antenna you want to do the radiating? Coax radiating inside your trunk or under the car does little for your signal.)

7088. Re: Putting CB antenna on TJ rollbar

Newsgroup: rec.radio.cb
Date: 2000-06-23 00:00:00 UTC
From: Jeff Strickland <jstrickland@ez2.net>
Message-ID: <DCL45.1236$p8.177172@newt.tstonramp.com>
Source record: 40826
Cross-posted to: rec.autos.makers.jeep+willys,rec.radio.cb

My Jeep came to me with the antenna mounted to the left rear quarter panel (fender), and I tore the antenna cleanly off. Upon replacement, I ripped the antenna cable from its moorings on the very next trip. Of course, this could be a result of my preference for Manzanita oil to clean my soft top windows <g>. I moved the antenna after that.

7090. Re: What happend to Tollfree & Train???

Newsgroup: rec.radio.cb
Date: 2000-06-23 00:00:00 UTC
From: Bill Eitner <kd6tas@freewwweb.com>
Message-ID: <39539BA4.CA064338@freewwweb.com>
Source record: 40828

He designed the bias circuit--that's it. And he did that to
make the amps sound better on SSB and make less RFI in base
station applications--not to make them more powerful.

I talked to him on the phone recently, and he wanted me to make
sure everyone out here knew that if it ever came up. He also
wanted me to let everyone know that he never has and never will
make any money off of X-Force.

As a sideline he does "tough dog" amp repairs. In other words,
he ends up with the ones the other techs can't figure out or
make work acceptably well. That's the main CB-related thing
that he does.

He likes to shoot pool and drink beer on Friday nights, so some
of the local CB guys show up occassionally. The same goes for
meeting one or more weekend mornings per month at a local coffee
shop. At those events he's willing to offer some help and answer
questions if need be, but he's definitely not spending any of his
time grinding out leading edge CB amp designs for X-Force or anyone
else.

Your radio is definitely not in the hands of an expert--so beware.

The MB8719 chassis Grants and 148s have been around since 1978.

Beg to differ with you, too, but there is no way to actually tune your antenna to resonance by adding or trimming the feedline coax, it's the antenna element(s) that need the pruning. If changing coax length shows a different VSWR reading, than there are other factors affecting your system, that are probably not good for an efficient set up.

Source record: 40831

I would definetly recommend the Ranger RCI2950, but I would leave it as close to stock as I could...Why not buy a Galaxy 99V, and have echo, and your rogerbeep.., (and a MUCH better recieve meter)..already in there from the factory?? There are a lot of technicians out there who will do more harm than good with your 2950.....
The only downfall with the Galaxy, is that it is not stable on sideband, but I think it has better channel-to-channel rejection, than the 2950.....

For the mic, I like the 575, but the D104M6B sounds better with the 2950, I own both mics......

The Wilson 5000 magnet mount, in the center of the roof, ...will work very well in all directions.....

As for the amp, I WOULD NOT go with a Palomar "Elite" 600HD...I don't know what kind of car you have (i.e., what size alternator)..But I would recommend a Texas Star 667V, or an X force X400 (that has been class AB biased, along with a SSB delay installed..).. Both of these have variable power output, and have 1)2SC2290,
driving 4)2SC2879 Toshiba Transistors...

both of these amplifiers will talk right over the top of the 'Elite600'........

You can find everything you need at ExportsRus... www.xportsrus.com

If you're dreaming about radios you have problems......

Maniac "373"

Really don't care for radios with internal amplifiers...... I like the Ranger RCI2950, with the Texas Star DX350HDV, will get out better than the 6900.....With the RIGHT antenna.......

7095. CB Linear Amps - Anybody have one for sale ? / Where to get them ?

Newsgroup: rec.radio.cb
Date: 2000-06-23 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <uJN45.13920$qS3.36567@tor-nn1.netcom.ca>
Source record: 40833

Could somebody let me know if they have a CB linear amp for sale, or where I could go to order one ? Nothing too powerful, it will be mainly for mobile use but must work on SSB.

Thanks,

Richard.

7096. Re: Looking to trade 2950 for Galaxy DX88

Newsgroup: rec.radio.cb
Date: 2000-06-23 00:00:00 UTC
From: maniac9188@aol.com
Message-ID: <20000623141406.02566.00000342@ng-da1.aol.com>
Source record: 40834

Just because a radio COSTS MORE, doesn't make it a better radio..... The 2950 is a MUCH better radio. NO OTHER radio has the usable options that the 2950 has..
Can a Galaxy split frequencies?? NO....., Does a Galaxy have ANY programmable memory channels?? NO.....(the 2950 has 10) Can you scan channels with a Galaxy?? NO.....Channel Change buttons on the mic?? NO...., 2950 does..

The Galaxy 88HML doesn't even have variable power output!!! It is chock full of 'GoodBuddy' toys, though.....

Trust me, You will make a BIG mistake, if you trade... The Galaxy might do maybe two, or three more watts or vice versa.. They are very close on output watts.......

Message-ID: <15065-3953AE9F-60@storefull-116.iap.bryant.webtv.net>
Source record: 40838

On wednesday i talked to a mobile on the Tennesee Georgia border who was running a Ranger 2950. I was on my Galaxy DX 2527 base station thru an Antron 99 and we were running FM. He was running 10 watts and i was running 7...i had about a 3 pound receive on him and the audio quality was just killer. Nice and clean and crisp...not full quieting, but very clear and almost no static.

I have made several other FM transmissions that were over 2000 miles on just a few watts.

DOES ANYONE TALKING KNOW WHAT THE HELL THEIR TALKING ABOUT ?????
[Follow Ups] [Post Followup] [Search Messages] [Back to Radios main page] [FAQ]

Posted by DEUCES (WORLDWIDEDEUCES@HOTMAIL.COM) on June 20, 2000 at 22:24:16
I READ THESE MESSAGES POSTED ON THIS BOARD ABOUT THE DIFFERENCE IN THE AMPS, THE WATTS, THE
OVERALL PERFORMANCE ECT. MY QUESTION IS: DO ANY OF YOU TALK ON THE BOWL??? THAT IS
THE SUPER BOWL (27.025) IF YOU AIN'T TALKING ON THE BOWL..... THEN YOU AIN'T TALKING.
AND ALL THESE SO CALLED SHOOT-OUTS..... DON'T BRAG ABOUT WINNING A LOCAL SHOOT OUT
WITH YOURSELF, YOUR CLUB AND THE REST OF THE LOCAL MUDDUCKS.....
IF YOU WANT TO KNOW
WHAT'S WINNING GO AND ASK SOME OF THE STARS OF THE SUPERBOWL.....
DON'T ASK A MUDDUCK !!!
THE TRUTH IS THEY ARE ALL WINNING..... GO TO THE BIG BREAKS AND SEE FOR YOURSELF.....
HOT SPRINGS ARKANSAS WILL BE ONE OF THE BIGGEST BREAKS THIS YEAR.....
THERE WILL BE CB'ERS FROM
AS FAR AWAY AS THE MINI GRASS..... THEN THERE WILL BE MEMPHIS IN NOVEMBER..
ASK A SUPERBOWL SUPERSTAR WHAT THEY "WIN" WITH..... HERE IS A SHORT LIST OF
NAMES AND THEIR WINNING WEAPON OF CHOICE.....(I apologize to my big brothers that I don't
get completely accurate but some of you I know without a doubt)
PEEKABOO, CHILL FACTOR & SB, HANKY PANKY and the rest of the Hillsboro connection: GOOSE RIDER AMPS
WORLD WIDE BB (florida) : Dave made Foxie built and others. -winning every class in more breaks than anyone else!
Mr. SHAGGY DAWG (wheatfields) : BIG DAWG AMP -winner in 8 & 12 pill class Memphis Tenn. 2 of last 4 years
PIT BULL (byu) : COOKIE MONSTER AMP -winner 32 pill and DC sky Hotsprings 1998.
I ONLY NAMED A FEW, BUT SOME OF THE AMPS DON'T EVEN MAKE YOUR SO CALLED BEST AND WORST
CATEGORIES.....SO KNOW WHAT YOUR TALKING ABOUT BEFORE YOU TALK.....
AND IF I CAN'T HERE YOU OR SOMEBODY TALKING TO YOU FROM TIME TO TIME ON THE SUPERBOWL.....
THEN YOU AIN'T TALKING !!!

2 radios come to mind:

Panasonic Big Wheelers - unbelievably complicated design and poor performers

Well CB's - a real piece of trash.

Ten-foe! Did not mean to imply that you should run out and buy one. Thought you may have one laying around. That is what some folks around the Suawannee River area did. Some of those storms here wreak havoc and a few stuck a stainless up top when the need arose.

Doing what you describe below will probably work fine. If you have noise you will want to connect both 12 VDC and ground directly to the battery (fuses on both wires for safety).

In a previous article, Geoff <geoff@NOSPAMwinchester.k12.ma.us> writes:
>Is hooking a cb radio up just like hooking up any 12 volt accessory?

You should be able to get the SWR at least as good, perhaps a little better. I agree with your opinion of Rat Shack, but I doubt if they could screw up something as simple as a stainless 102 inch whip.

Source record: 40905

Here's a wire size chart from a marine magazine: (unknown mag and date)

LOAD | FOOTAGE OF WIRE
(AMPS) | 3' 5' 7' 10' 15' 20' 25' 30' 40' 50'
---
3 | 18 18 18 18 18 16 16 16 14 14
5 | 18 18 18 18 16 16 16 14 14 14
7 | 18 18 18 18 16 16 14 14 14 12
10 | 16 16 16 16 14 14 14 14 12 10
15 | 16 16 14 14 14 12 12 12 12 8
20 | 16 14 14 14 12 10 10 10 8 8
24 | 14 14 12 12 10 10 8 8 6 6
30 | 14 14 12 12 10 10 8 8 6 6
40 | 12 12 10 10 10 8 8 6 6 4
50 | 10 8 8 8 8 8 6 6 4 4

(text from the chart:)
Decide how many amps of load the power wire has to carry, and how many
feet of wire you need to use. The correct wire gauge for your installation is
shown where the amps and feet of wire intersect on the chart.

: What is the difference between AB1 amps and C amps?

AB amps are most often used for AM and SSB (linear) modes of
modulation.

Class C amplifiers work well for FM and some digital modes of modulation.

You really wouldn't want to interchange them.

cheers
skipp

This chart only considers one wire?

If running for example a 20 amp load that is 20 feet away then you
would need a total of 40 feet of wire. 20 feet at 12volts, and another
20 feet of ground return. Thus according to the chart you need to use
#8 wire?

Or has this already been figured into the chart and you should use
#10?

Message-ID: <E1R45.78451$m5.21341@typhoon.kc.rr.com>
Source record: 40911

Ok...here is what MY copy of the NEC 1999 code book reads..Page 70-67 230-79 (c) For a one family dwelling, the service disconnecting means shall (shall = MUST HAVE) a rating of not less than 100 amperes, 3 wire. BTW they CHANGED it this code change. NOTE the line to the left of the art. True it USED to say 60 amps was the min. till this code change.

To follow up on this on table 316-10 (pg 70-126) THW or any other 75 degree C rated wire the max allowable amps is 85 amps..number 3 is rated at 100.

And the inspectors around here DO refer to table 310-16 when sizing the service. Of course every area and State is different as the code book is NOT law just a guide line. Most of them do adopt the code as their law with things added to suit the needs of that State. Like here in Kansas we really are not to worried about saltwater :) for marinas and bootdocks!!!!

And yes I have "read" the NEC. I am a Block certified master electrican. Big whoop and besides the point but I have it neverless...Now understand I am NOT CLAIMING to be the smartest electrician here as I am always learning in my trade!!!

Found on page 70-20

And I may have been incorrect in the duty cycle abit.

Duty cycle is defined as Cotinuous Duty: Operation at a substantantially CONSTANT load for an indefinitely LONG time.

Intermittent Duty. Operation for alternate intervals of (1) load and no load: or (2) load and rest: or (3) load, no load and rest.

In my mind I was sort of comparing it to a welder. Which the welder is running full time but not pulling a greater load untill the electrode is shorted to ground. Whereas the amp is on put NOT pulling a large load untill it is keyed up. Of course you "could" key down for an indefinitely LONG time. But you sure will not be doing that on any amp I own!!!!!

What is on the web page is the 96 edition of the NEC :)

Again I was just giving him MY thoughts. And sure I cane and am wrong on alot of things...this one is what is the normal for MY AREA!!!!

And you are correct in the #6 ...but you could still derate the size of the wire using the Intermittent dudy definitions. HOWEVER I WOULD NOT if it was mine.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^

HHHHHuuuuuuuuuuummmmmmmmmm yerself...all I stated was that I have been in the electricial field for 27 years. DID not say I was an engineer or some such rot now did I??? :)

This post was done in fun...NOT slamming Capt. Crunch or anyone else. Did make me go get my code book out of my truck however!!! :)

Peace to ya all.. and really sorry about such a long OFF TOPIC thing but damn it Jim I am an Electician NOT a amp expert!!! :)

'side all this LINEAR amps for cars/truck are NOT covered under the NEC any old ways !!!! Just I was comparing it to that.

7147. Re: Opinions wanted on a President George mobile receiver?

Newsgroup: rec.radio.cb
Date: 2000-06-23 00:00:00 UTC
From: Bill Eitner <kd6tas@netzero.net>
Message-ID: <01bfdd66$af0b0180$902bd1d1@eniac>
Source record: 40920

The George is the next step in the evolution of the 2510.

It's a great all-around radio, but is not a specialty AM TX radio.
It runs 3 (yes three) final transistors and will comfortably run
at 55 peak watts on SSB. However, like the 2510, it won't key
low and swing high on AM because it doesn't directly modulate
the driver and final stage. That's a problem when running most
amps.

So, the choice is yours. I recommend it for mixed mode (some
AM or FM and some SSB) use with a *straight* (no driver stage)
4, 6, or 8 device amp, but not as a competition (AM-only use
with a one or two device driver) radio.

The price is fairly high too. Make sure it's really what will
best suit your need before you make your purchase.

Whistle, hum, or hold the first syllable of the word
"audio" into the mic while adjusting all the knobs for
a maximum reading on the front panel meter (or a peak-
reading wattmeter). In other words, adjust all the
knobs for maximum modulated (peak) power.

Source record: 40922

I had the chart sitting around. I don't have the article that it came from. Notice that it only goes to 50 amps. CB folks need higher ratings. My guess is it is the gauge of wire that will show the needed voltage at a given current with an "acceptable" voltage drop. If it's only good for a starting point, so be it.

tnom@mucks.net wrote:

7150. Re: Palomar 300A Help!!

Newsgroup: rec.radio.cb
Date: 2000-06-23 00:00:00 UTC
From: w5lz <w5lz@oio.net>
Message-ID: <3953EF1D.C7089A0@oio.net>
Source record: 40923

The Moskals,
Here is an easy way to tune almost any amplifier. Use
an external watt meter, and with low drive power, tune the
Plate and Load controls for maximum output on the watt meter.
If the meter in the amplifier is not switchable to read
grid curent or collector current, then it's a relative reading
meter and the knob on the back of the amplifier is to keep
the meter readings 'on scale'.
You have to know what the maximum grid or collector current
is for the devices in the amplifier. eg; for 811A's it's 50 mil
per tube; for 8877's it's best not to have ANY grid current.
If you don't know the requirements of your amplifier, don't
turn it on! It can cost you a lot of tubes.
'Doc

Frizz,
-------clipped--------
> www.ebay.com (getting harder to find, have to do more specific searches,
> Thank the holier than thou Hams for that.)
-------clipped--------

I don't think so. Rather, blame the people who build
'dirty' amplifiers. The people who don't know how to
operate 'clean' amplifiers. The "all knobs to the right"
people. And the other people who interfere with consumer
electronics.
If it wasn't 'dirty',(for whatever reason), they wouldn't
know 'you' were there.
(You'll notice I didn't say a thing about CB amplifiers
being illegal to start with.)
'Doc
PS - I don't know about the part about being 'holier'
than you.....

The problem is that we as a group use devices that are
better described as "reflectometers" than SWR meters.
(The coveted Bird 43 falls into this catagory too.)

Reflectometer readings increase if the antenna system
(antenna AND feedline) isn't resonant *AND/OR* if the
impedance is mismatched AT A PARTICULAR POINT ALONG
A COAX RUN. In a practical sense, that's EXACTLY what
we want to know. Think about it. Mismatches are not
always the antenna's fault. Prototype amps that are
put into use a little too soon will benefit from the
use of a reflectometer that allows the user to tune
the antenna system to the (something other than purely
resistive 50 ohm) output of the amp.

Since the impedance changes with line length when the
line isn't "flat," any reflectometer will display the
change in the ratio of forward versus reflected voltage
with changes in line length. That's NOT a bad thing.

This is what Amor Powers (a respected *female* RF
engineer) was telling us 3 years ago. But would
anybody listen? No. That's why she's gone--because
she figured out that we're basically just a bunch of
boneheads. Thankfully I listened to her and learned
something that I can pass on to the newer people now.

It's funny how some can say the SWR reading doesn't change with
line length but at the same time suggest to put the swr meter at the
antenna.

This makes a lot of sense.????

Thats for the radio itself. The antenna tuner is another $250.00. Not the greatest on am but kicks ass on fm and ssb. I think its a fair price for both.

Professor,
Where do you buy your 'lossless' coax? In other
words, the example used in the quote is not exactly
what you want to use to 'prove' your point. It is an
'ideal' case, or imaginary situation.
I do agree with you that the length of the coax feed
line should make no difference in what your SWR is. The
problem with that is that we're not dealing with absolute,
fixed values when your talking about coaxial cable. The
impedance printed on the jacket is a 'characteristic'
impedance, or the average impedance for a particular type
of coaxial cable. The actual impedance can vary around
10%, between pieces from the same spool of cable. Thats
why it's possible to vary the feed line length to change
SWR. It never makes the SWR better, it's just introducing
reactance to make the SWR appear 'better'.
The best way to correct a mismatch is to change the out-
of adjustment impedance. Most of the time that adjustment
is done to the antenna (when possible). Some antennas,
those with gamma matches, are easy to adjust. Other antennas
with no means of adjusting input impedance (typical mobile
antennas) are harder.
(Still like to know where you get that 'lossless' coax.)
'Doc

tnom,
Sure it does. It would tell you what the 'match'
was like between antenna and feed line. That, along
with knowing what the 'match' between radio and feed
line, can tell you a whole lot about your antenna
system.
'Doc

This is quite amusing. You fellows ignore FCC rules. You cry about your rights to use high powered amplifiers, be the loudest on the band, and transmit on any frequency you choose. You quote the law of the jungle.

Until you run across another fellow that feels the same way you do. Then you either want the FCC to swing into action and clamp down on him, or you want to take violent vigilante action.

Jarry, Jarry, Jarry. Pull your head out of your rear. Show me one post I "cried" about amplifiers. Go on, search, you big baby. You will not find it. I did not say anything about vigilante action, either. I know you like giving me guff Jarry, but if it is a battle of wits, I refuse to take on an unarmed opponent.

Source record: 40962

Ive seen a few requests from some of you out there as to "who makes the best/worst radio's ever made.....well after 26 years of collecting,selling, using, fixing, and living C.B. here are my finding's, (replies can say whatever they want, but this is fact).....Ive had at least 2 of each of the following radios, 1-Cobra 2000, 2-Browning Golden Eagle's, R27' MarkII MarkIII Mark4 Mark4A, GE Super Base, ARF2001,Stoner's, Galaxy Saturn, Super Galaxy Mobile, Galaxy Pluto, RCI 2950, and to keep it short 2 Tram D-201/201A, of all these radio's I used these criteria to judge the radio's....receive, transmit, quality of transmit audio, ease of use, reliability, ease of repair, functions, and circutry, NONE of them could even come close to the "Hand wired" Tram D201, OR the 40 channel Tram D201A, PERIOD!!!!! in my portion of the country (CT) they used to sell for between 900.00-1,000.00 dollars within the 4 C.B. shops in my area, (very expensive for a C.B.) BUT for that money, you were investing your money wisely, even today, I see them selling for at least 350.00, and if its in "collectors grade mint condition" I even see them up to 633.00 dollars.(on e-bay) now you cant find too many radios that you could re-coup almost 75-80% of your original investment. I furthermore would like to say that the Browning Golden Eagle Mark 4 and 4A, are a very close second, another fine example of being able to re-coup a 65-70% of the selling price on. Take this for whatever its worth, but these radios are pretty old, as a matter of fact.....the D201, is around 26 years old, and its STILL one of the most collectable, rare, best investment rig's around. I hope someone out here has enjoyed reading my thought's, and I wish you all well.....73, Cobra 52.....is OUT!

7219. Mobile antenna tune...

Newsgroup: rec.radio.cb
Date: 2000-06-24 00:00:00 UTC
From: Professor <bgriffey@kwom.com>
Message-ID: <9Hb55.22810$Q7.734866@news-east.usenetserver.com>
Source record: 40977

That depends on the antenna...
Some have an allen set screw that secure the whip. By loosening the screw and raising or lowering the whip the optimum match can be obtained for a specific vehicle. Of course you would have to monitor your progress with an SWR meter... trying to obtain the lowest SWR reading which corelates to the least amount of reflections.

Some mobile antennas are not tunable and have a factory default setting for impedance match.

What antenna are we talking about exactly?

Alright, but you have to understand, saying "Radio Shack SUCKS" is being awfully unfair to the company. My local Radio Shack employs about 5 people that really know what they're doing, they're not just a bunch of 18-year old kids. Also - everyone makes mistakes sometimes (need I point out your numerous grammarical errors?) so it's hardly fair to make this one incident end your business with them (isn't it possible the payment got lost in the mail? How could that be their fault?).

The TRC-236 is a handheld CB, not a "walkie talkie".

And please excuse this stupid question, but what is "Super Swing?"

Professor wrote:

Super swing is a slang name that I have given to DSB-SC(double sideband - supressed carrier). It's a mode that works quite well for several reasons. It greatly enhances modulation on a standard CB rig as well as conserving battery power on handhelds.

While I have met with the guys from X-Force and Dennis also, I would think
that Dennis' input on their circuit design would be welcome whether he was
making anything on it or not! The part you miss in this post is that while
competition is about POWER, Getting the power in the proper bandwidth and
not as a harmonic only adds to the on frequency output and in the end will
allow the amp to work better in the given spectrum.

>
> Prof,

I think you are a little off. One "S" unit is 6 db. It takes 4 Times
a given power to equal 6 db of additional received signal--hence 1 "S"
unit (beginning with 4 watts) to the plus side would take 16 watts,
another "S" unit would take 16 X 4=64, 64 X 4=256. Two Hundred and
Fifty Six watts to achieve 3 additional "S" units, and so on. This is
directly from the ARRL Handbook. Now I posted this, not as a challenge
to your knowledge, nor as a flame. Check it and see if I am right
according to published RF theory.

I always thought you had to double your power twice to get an S unit, i.e 4x power increase. Isn't an S unit worth 6db?

P.S. Why do you run a 2 watt deadkey? Wouldn't 20 watts be better for 100 peak?

Your figures have been stated before... but it has been my experience over the years that my figures are closer for CBs. Amatuer radios may have a different relative scale that is tighter and requires more change per s unit... After all the "S" meter is only a relative type scale and can be scaled differently.

Why??? The higher dead key serves no useful purpose... As long as you reach your maximum amplitude.
It also has the an advantage when the modulation is involved. By having a greater overall amplitude shift... you boost your overall modulation potential at the receiver. My set is modified so the final output is about 50mW! It swings to about 5W RMS. This produces about 2-100W swing at my 1pill output. The modulation is absolutely fantastic! We have recently proved at a keydown that a higher carrier is not only not an advantage... but a detriment because you can't realize the amplitude shifts of super-swing. We had two mobiles side by side with a recorder set up at my house about a mile away to monitor. The recording set had only an indoor antenna. The following equipment was used:

Me with:
Cobra25LTD 50mW-5W drive
My 1pill finished amp (2W-100W)
Wilson1000 magnetic

Gunsmoke with:
Cobra25GTL 1.5W-5W drive
My original 1pill prototype - identical to mine (50W-100W)
Full 1/4 wave whip

The tape revealed that I was the winner. Although you could clearly hear Gunsmoke between my words... when I spoke... the tremendous modulation (caused by very high amplitude shift) covered him! He even had the better antenna! Email me for a wav file of the tape if interested...

Bill is right! There will always be measureable reflect power
in ANY line, more so at higher power. References to 'flat' line
mostly mean 300 ohm type lead lines used for impendence matching.

GOOD FRIEND <chocalatejay@webtv.net> wrote in article
<3498-3953BC99-24@storefull-213.iap.bryant.webtv.net>...
> DOES ANYONE TALKING KNOW WHAT THE HELL THEIR TALKING ABOUT ?????

I certainly do.

I tried to help you (this guy e-mailed me personally)
and you spit in my face like amps made by black men are
the only ones you care about.

That makes you a worthless racist that isn't worth
responding to.

You certainly aren't my "GOOD FRIEND." You're just
another loser that wants someone out here to make
your amp decision for you.

Your biggest problem is that you can't accept the
fact that the most successful, leading-edge CB amp
builders are white men.

With that in mind, go to Prime Minister (Skullcraka)
and buy what you think you can handle. If you stay
on the west coast with a Skullcraka amp you'll pro-
bably be fairly successful (if your vehicle and setup
is decent and no one (like me) shows up with a Dave
Made or X-Force in your class). It's guys like you
that'll force me into competition just so I can enjoy
laughing at you while you drive off the line after
I've kicked your ass.

Thats the opinion I always had of Dennis... Always there to help, not to make a living off others. You can tell very quickly about many of the people who have posted here over time. Some actually attempt to help with no gain for themselves. It's an easy thing to do, help without criticizing others. Not many have mastered that yet. It would be a much nicer place if more were like that..... I used to learn a lot from his and others posts here. Now it seems you learn a lot on how not to act.

He designed the bias circuit--that's it. And he did that to make the amps sound better on SSB and make less RFI in base station applications--not to make them more powerful.

I talked to him on the phone recently, and he wanted me to make sure everyone out here knew that if it ever came up. He also wanted me to let everyone know that he never has and never will make any money off of X-Force.

As a sideline he does "tough dog" amp repairs. In other words, he ends up with the ones the other techs can't figure out or make work acceptably well. That's the main CB-related thing that he does.

He likes to shoot pool and drink beer on Friday nights, so some of the local CB guys show up occassionally. The same goes for meeting one or more weekend mornings per month at a local coffee shop. At those events he's willing to offer some help and answer questions if need be, but he's definitely not spending any of his time grinding out leading edge CB amp designs for X-Force or anyone else.

bill i am sure his salary at lucent more than takes care of his needs.
needless to say he could care less probably about chump change,....cd
is out........ps. i remember the first time i got on here and i knew
right away who knew things and who didn't and he was one of them that i
considered a pro. i think he is probably one of those guys who bleeds
rf if you were to cut him, and he has forgot more about rf stuff than
some of us know, cd is out again.......

<< (Still like to know where you get that 'lossless' coax.)
'Doc>>

Doc,
You've been hanging around CBers too long. 450 ohm open wire balanced feedline and 300 ohm TV twinlead as well are practically lossless feedlines on the HF bands. Coaxial cable is not and the higher the SWR, the greater the power lost and dissipated as heat in the feedline. As a matter of interest, RG-58 coax has an attenuation (loss) of 2 db per 100 feet at 21 MHz and a loss of about 2.6 db per 100 feet at 30 MHz while the larger RG8 has a loss of 1 db per 100 feet at 30 MHz. Common TV 300 ohm twinlead has a loss of about .4 db per 100 feet at 30 MHz and 450 ohm ladder line has a loss of about .16 db per 100 feet at 30 MHz.

A one db loss may not seem significant but what it means is that if you put 100 watts into a system with a 1 db loss, about 80 watts will come out. A 2 db loss with 100 watts in means that about 63 watts are coming out. Bear also in mind that this line loss is only true in a matched system (the antenna feedpoint impedance, the feedline impedance and the transmitter output impedance are all the same). When such is not the case, there is an additional loss due to the mismatch as a function of the SWR and line attenuation.

Definately overpriced! an ok radio but in my opinion not worth the
bux....
Add a little more money to the price and buy a nice HF Ham rig..... I
don't care for Echo equipped radios but the one in this thing is crappy....

Probably your best bet would be to hunt down a Tram D201 or D201A,
preferably the 201A, 201 is 23, 201A is 40 channels.... Very Easy to mod
for HF, uses the internal VFO, and its a helluva talker besides! A distant
Second would be A Browning Golden Eagle, Kind of Mediocre on SSB but an A$$
Kicker on AM! These are both long out of production, Vintage radios and
are currently demanding Top $$$......

Either one is an extreme pleasure to use, but if your wanting SSB go for
the Tram!

Those things have an A$$ backward polarity compaired to MOST other radios, The radio is correct unless someone already changed it.... Either hunt up the correct ones (probably tough to do!) or switch the wires inside so that they match the power cord..... Now you could just use the black for positive and red for negative, but if you take the radio in or out at all, you can bet you will most likely reverse polarity sometime or another..... no real big deal if you do as long as it is fused, most it will do is pop the internal diode! but still a pain in the butt.....

i recently bought a basic mobile CB for my 4x4... its a midland 77-115..
i need a antenna for it....however my truck has a full fiberglass roof..
so i belive a tall 102" steel whip antenna would be best (it has to go
on the rear bumper) and to keep it from breaking on trees while
hunting/ wheeling... In your opinion is this a correct choice? I still
need to be loud in case i breakdown.... If it is a wise choice, how do
i tune it???,,, sorry to ask such simple questions.. but you have to
start somewhere

chocalatejay@webtv.net (GOOD FRIEND) Who is the best out these Four
Black Linear Builders! DC Only
I AM DOING THIS SURVEY FOR OUR CB CLUB WE HAD DISCUSSION ABOUT THIS
TOPIC THE OTHER NIGHT AT OUR WEEKLY MEETING.THE FOUR BUILDERS ARE 947
SPECIAL west coast-Los Angeles,California,Triple Deuce-Witchita, Kansas
wheatfields of Kansas,Skullcracka-Tacoma,Washington Northwest Corner,And
Foxie-Orlando,Florida Sandpile.We are just wondering who is the best for
quality,performance,and apperance out of these four.Please guys could we
stick to the topic this time i am just asking a question i am not in no
way trying to leave X-force and Davemade out.I am just doing a survey
for our cb club to see who is Deserving of award for our 2001 break in
Baton rouge,la.The Tri-parish modulators.So if any of you had any good
or bad experiences with Foxie,Skullcracka,Triple deuce or 947 please
emali me and let me know.Thanks!

Message-ID: <%Q055.17944$Q7.547884@news-east.usenetserver.com>
Source record: 41101

Well... my general rule of thumb is that you must double your power output
to move up an "S" unit. This is only a rough estimate. So going on that
assumption... my dead key is 2W... my fully modulated is 100W(RMS). So...
4W 1 "S" unit
8W 2
16W 3
32W 4
64W 5
128W 6

So I have about a 6 "S" unit swing.

There is only one mod I recommend for any walkie talkie... Super Swing!
It boosts the modulation dramatically as well as increasing battery life by
2-3 times!
Do you have the schematic? If so... we can discuss option.

Nonsense... "flat line" type transmission lines are virtually lossless as well as short (<20feet) pieces of coax... often found in mobile applications. So why are some of these folks out here attempting to reduce their system SWR in a mobile by changing the coax length? Not advisable...

P. S. Certainly hundreds of feet of coax has significant losses and would not fall into a "lossless" category.

: << (Still like to know where you get that 'lossless' coax.)
: 'Doc>>
:
: Doc,
: You've been hanging around CBers too long. 450 ohm open wire balanced
feedline
: and 300 ohm TV twinlead as well are practically lossless feedlines on the
HF
: bands. Coaxial cable is not and the higher the SWR, the greater the power
lost
: and dissipated as heat in the feedline. As a matter of interest, RG-58
coax has
: an attenuation (loss) of 2 db per 100 feet at 21 MHz and a loss of about
2.6 db
: per 100 feet at 30 MHz while the larger RG8 has a loss of 1 db per 100
feet at
: 30 MHz. Common TV 300 ohm twinlead has a loss of about .4 db per 100 feet
at 30
: MHz and 450 ohm ladder line has a loss of about .16 db per 100 feet at 30
MHz.
:
: A one db loss may not seem significant but what it means is that if you
put 100
: watts into a system with a 1 db loss, about 80 watts will come out. A 2 db
loss
: with 100 watts in means that about 63 watts are coming out. Bear also in
mind
: that this line loss is only true in a matched system (the antenna
feedpoint
: impedance, the feedline impedance and the transmitter output impedance are
all
: the same). When such is not the case, there is an additional loss due to
the
: mismatch as a function of the SWR and line attenuation.

I don't really believe we're reading SWR with the instruments we use.
That's why the reading changes with line length on a mismatched line,
and why I suggest putting the instrument at the antenna end if possible.

That question pretty much answers itself. X-Force produces amps
for competition as well as daily use and base station applications.

I disagree. To change the ratio of forward to reflected voltage
(which is what the instruments we use are actually measuring), the
forward, the reflected, or both have to change. The instruments
use two identical diode detectors, so why should only the forward
change? The truth is that both forward and reflected are different
at different points along a mismatched line.

If your test results indicate that the reflected isn't changing
at different points along the line, it's very likely that the
forward isn't either which indicates a flat (or matched) line.
Of course it could be argued that if there is any reflected
the line isn't flat. However, in practice, there's always a
measureable amount of reflected even on a flat line.

Who knows the mic configuration on the Maxon MCB-30 or where can I go to get the schematics of this radio. I'm making it portable for use on a Motorcycle. I can get it to do everything but either the push to talk doesn't work or if the push to talk works I get deafening feedback both from my headset and it is in the background of the radio that is receiving.

Your help will be much appreciated!

Dale

For Sale: Radio Shack TRC-496 CB Radio - 40ch, Scan, WX

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=365845123

40 Channels
5 watt output
Selectable Mic Gain
Scanning
Clear Channel Scan (finds clear channel for you to use)
Dual Watch (monitors 2 channels at the same time for activity)
NB/ANL for background noise reduction
Quick Access to Channel 9 & 19
Receives all National Weather Channels across the US
PA Feature - Has 1/8" jack for hooking up to 10 watt PA speaker
External Speaker - Has 1/8" jack for hooking up to external speaker for louder audio
Detailed LCD Graphical Display for transmit/receive signal strength, scan activity, etc.
Comes with mic, power cables, & manual.

This unit is in excellent shape (9 out of 10 cosmetically) and is guaranteed to be in 100% working condition. Selling because it is not needed anymore. I've been told that this radio is worth over $100! No Reserve Price! Please email with any questions. Good luck, and thanks for looking!

s units = 6db is rarely right on cb's. there more often than not calibrated
closer to 3 db a s unit on most radios.

My local radio shack and a couple more I have been in around the KC metro do suck! They are more interested in selling Sprint services than anything else. For exp. I needed a MOV. I ask the STORE MANGER where they were at, His comment to me was "Oh we do that carry that" After I had him get the RS catalog and SHOWED him that indeed radio shack did carry them and after I searched the store, I found them.

I can remember when RS was a hobbyist haven. Needed some advice or stuck on a electronic problem, it was more likely than not they could help you. Unfortunately that is not the case anymore. I realize there probably a larger profit margin in selling cell phones and computers and not the other parts and peices. But it is still a sad affair.

The problem is more wide spread in my area than just RS. Best Buy , CompUsa , and quite a few more places have the same problem. Of course pay them 5.15 an hour and what would you expect I guess!!!

I am NOT saying this is the way it is across the USA. But here it sure is!!!

One more light note here. I am damn glad that I can TALK on the CB rather than have to write on it!! My spelling and grammer aint so good! :) SO any and all mistakes from me , ARE to be expected.

You should know that definitions and practicality are
different animals. There's always another order of
magnitude. In other words, if you can measure small
enough quantities, the transmitter will always be off-
frequency and there will always be some reflected power.

These radios are great...
I feel the Hr-2600 is made a little better than the 2510...
You cant go wrong with these radios, and the Chipswitch makes it even
better...
But, thats just my opinion..

It tells you that the salesmen are getting paid on commission, and they are geting paid more to sell that product.
I work in commission sales, and I enjoy it for the most part. The exception is when you have a customer who has no intention of buying, but will make every attempt to tie your time up and then inform you that they will be buying at Christmas. As much as I would like to help them, if they need hours of written documentation instead of a recommendation they can also go to the web site and get that info if they have that much time. Some of those jerks will stare the paint off those products twice before reaching in their pocket, and then return the product scratched up only to start the process all over again... retail isn't easy if you haven't done it.....

The radio choice you made is the opposite of your desire to get out if needed.
The cheapest radio that works well is a Uniden PC68 or 66

>however my truck has a full fiberglass roof..
>so i belive a tall 102" steel whip antenna would be best (it has to go
>on the rear bumper) and to keep it from breaking on trees while

>If it is a wise choice, how do
>i tune it??

In your case that is probably the only choice, just put the big (6") spring on
it and 18' of good quality coax, make sure your mount gets a good mechanical
ground and seal (waterproof) your coax connection.

7353. South Africa : Where to find CB radio's plus related equipment?

Newsgroup: rec.radio.cb
Date: 2000-06-25 00:00:00 UTC
From: anonymous <spammenot@spammenot.com>
Message-ID: <3955A014.507D439@spammenot.com>
Source record: 41076

I would appreciate any info given , e.g. current dealer's , clubs ,technical info etc , available in or doing business in South Africa. Also , info on FRS equipment, modifying cell phones for two-way radio(eg from GSM working) , like in the film "The Long Kiss Goodnight".

27 Mhz CB was popular here , once , about 20 years ago. Only 9 channels were allowed (19 to 27 , and by convention 26 and 27 were used for ssb , 4W am , 12W ssb p.e.p) .Of course , 40 channel rigs and easily modified designs became most popular.

"Most wanted" rigs were IMHO : Cobra 148 GTL ,Cobra 140 GTL ,Royce 639, General Electric "B" models.., President's etc.

Popular antennae : 5/8 base station , "Lady with a skirt" (like a 1/2 wave or 5/8 dipole with slightly bent bottom element with bottom ring attached), 1/4 wave "spider", or if you were really serious , a 3-4 element Yagi (directional , so of dubious legality).

For road use : K40 whip + K40 microphone. Leson base-station power-mic if you wanted to. Also popular : Million-M-One whip or 1/4 wave whip.

Skips were great, world-wide if you could get thru the QRM occasionally.

No... the term "flat line" (although you're right is a type of 300 ohm transmission line describing its physical shape) we are talking about refers to a condition on ANY type of transmission line where no standing waves exist! Therefor there are no reflections!... and no reflected power!

Went to the site (userm.com) to check it out. Encountered 404 code "file not found". As a brand new person to this site, I am wondering if there is a FAQ page covering this group? Hate to get flamed for asking questions that have already been covered. If there is not a FAQ page, I would appreciate any helpful info on a first rig (in a very long time) purchase. Had an old Johnson Viking Messenger back in the early 60's!

Looking for a middle of the road set up to use while traveling. Don't see anything wrong with a few extra watts to help talk. Would kind of like some of the toys like echo, beep, etc. Thinking of a mag mount antenna, but have heard that they are easy pickings for thieves. I am sure this subject is asked time and time again, but I have been checking out web sites for days and the choices are endless. Galaxies appear to be a good choice to me with the 2 yr. warranty, but as a 53 yr. old ex (retired) Navy man I value other's opinions and experience over hype any day. Thanks for the help.

Hello,
I really like the way Cobra and Uniden has backlit the face plate of their CBs. I had a problem of always turning the wrong knob when I drove in rural areas where there were no street lights. I have heard that Texas Ranger (Ranger Comm.) puts out the best CB. Could anyone tell me if they have this feature? I saw on the TR-396F there is a dimmer switch. Is this for the whole face plate, or just the signal strength meter window? Thanks, ryan

7372. NC shoot out

Newsgroup: rec.radio.cb
Date: 2000-06-25 00:00:00 UTC
From: wpbrock3rd@aol.com
Message-ID: <20000625094411.00661.00000090@ng-fe1.aol.com>
Source record: 41095

This past weekend there was a small but very well ran shoot out in NC, It was their first and everything from the registration to the banquet was well planed and executed. There was only one registration in the 16 pill class so #7 from Washington DC won by default, the laragest class was the 8 pill class, there was 11 mobiles and in it were some new faces as well as a few seasoned veterans to balance the fight. When all the smoke cleared the MOJO man (dave made) was the last man standing. The four pill class produced the same results, more MOJO (Dave made), what can I say he was the man to beat. To those of us that read the mail (rec.radio)the name 667 is well known and he lived up to his claim to be the man (useing his Dave made 3 pill) to beat on his 12 volt stock alternator system, He had to compete with mobiles sporting several alternators, 3 and 4 antennas and 2 pills driving 2 pills, but it was no problem for the first time competitor. The two AC mobiles to meet in a grudge match were better known for getting their name called in DX land went head to head for the NC title and all the bragging rights, REV IKE from VA,took out BIG Bill to take home the trophy. All in all it was fun, small, but a lot of good old home town guys showing off their stuff, talking trash, and telling more lies. PW

Why, in the swamps of Dixie of course. Legislation? Do not know what they do in Suburbia, but then again, it really does not matter. In communties that are so small that they do not even have a name, (many of those) no gun means you better have one hell of a garden. When the old blue nose tick hound sees the truck being loaded on Sat. mornings, he jumps right in for he knows within an hour or two we will return with 2 or 3 "Hog on the ground". Nothing the old dog likes to sink his teeth into more, except maybe a yankee!

>What is the required driver for this amp ???
>
>Thanx for the info.
>Randy

Depending on what you want the amp for? .. for key down i would recommend a max of 1000 watts..... Regular skip talking I would say 400-600 watts should give you what you need, depending on the power supply ofcourse...

>I still
>need to be loud in case i breakdown....

The radio choice you made is the opposite of your desire to get out if
needed.
The cheapest radio that works well is a Uniden PC68 or 66

>however my truck has a full fiberglass roof..
>so i belive a tall 102" steel whip antenna would be best (it has to go
>on the rear bumper) and to keep it from breaking on trees while
>hunting/ wheeling.
>If it is a wise choice, how do
>i tune it??

In your case that is probably the only choice, just put the big (6") spring
on
it and 18' of good quality coax, make sure your mount gets a good mechanical
ground and seal (waterproof) your coax connection.

Message-ID: <Ycv55.359$Kj.100220@news1.rdc2.tx.home.com>
Source record: 41157

It seems to me that there has been a lot of "race" talk lately so here
is my outlook.

It has occured to me that the largest % of CB'ers are
black while most of the "hams" are white at least in this group.

what does this mean?

and why is the usual talk (if thats what you call it)
on channel 6 and 11 mostly meaningless reapeted words and phrases?

Is there any actual conversation going on at these channel locations?
or is it just a bunch of guys yelling repeated phrases over and over
to see gar far they reach and how loud they can be?

On SSB and ham bands I hear actual conversation not just "Top Me" contests
like on CB.

what do you think?
I'm not taking sides just trying to figure out the diffrence here.

Just currious.

> issue? (I only have a 3' whip)

If the stations you are hearing are strong and local (not skip) they should be able to hear you if your radio is operating properly. Antenna height is definately a factor, as well as antenna length. Typically your 3' fiberglass whips leave much to be desired. A very good antenna for you to consider would be a Wilson 1000... This antenna would be a vast improvement.

>
> 2) What, exactly, does "breaker" mean?

Basically your asking the transmitting station/s to stop, or take a break in its communications so that you can make a call, ask a guestion, or comment....

> 3) what is "skip" and why is it illegal?

Skip recieved its nick-name as a description for what the radio signals do.. Imagine throwing a stone on the water, it skips acrossed the surface... Well there you have it, that is essentially what the radio signal has done, except the radio signal uses the atmosphere instead of water.... Skip is a by-product of eruptions on the surface of the Sun, the "Sun spots" erupt on a regular measureable basis, it occurrs in a multi-year cycle. Currently we are near the peak of one of these cycles. The Sun-spots cause changes in the atmospheric layers, which in-turn, causes radio waves to bounce off and return to earth. The point of return varies and is typically over 250 miles. If you would like a more precise explanation a good start would be your local libbary. As for its legality issue, The FCC in all its wisdom chose to make it illegal for CBer's to talk "SKIP"!! Kind of like putting a dog in a room full of steaks, and expecting them not to be eaten.... I guess the reasoning might have been sound, (I have no idea what that reasoning was), Regardless, the law exists, it is indeed illegal to communicate over the set distance! However most people ignore it and talk anyway...

Your skip question has already been answered, however a comment on your
not being able to get on the radio....

I would Guess that the reason is some type of restrictions set fourth
by the community or landlord. If this is the case perhaps you could use a
dipole antenna, basically its just some wire connected to coaxial cable it
can be made of thin wire and camoflaged. While not the best antenna they
work pretty well and would at least allow you to get on the radio.
Outdoors would be best, however you can use one indoors as well....

YEP, it is old news!! However it is still a timely bit of
information!!!!
Considering it is transmitted via email and NG postings!
I get Emails every day from various people all sporting the KAK WORM

I don't bother making a post about it, however when the post popped up i
saw a chance to add USEFULL information!! Obviously Its not too OLD of
NEWS, considering i can count at least 2 occurrences of it daily in my
email!!

Just because you find it "OLD NEWS" does not mean it is not timely or
usefull! This NG is FULL of OLD NEWS..... Most of it just adds a
new twist, some just plain TWISTED, some is exactly same-old... If you
posted about every bit of OLD NEWS out here you would INDEED be a very Busy
person.....

SLAP, SLAP...

I hate building them from the ground up. I like to start out with a good regulated 5 amp power supply with remote sensing. Then paralell about 4 of your favorite power transistors together. Feed the base of the transistors with the ouput of the power supply. Connect the sense line to the emitters which will be the final output. The collectors should be fed with a diode /cap arrangement that will give you at least 18 volts before regulating it. Since you are more than likely going to be running it at about 14 volts I would want the voltage to be about 20 before regulating it.

So what you're trying to imply is that since WHITE people are "HAMS"
and BLACK people are "CB'ERS" and HAMS hold intellectual conversations
and CBer's just repeat themselves with audio and power which makes
Black people broken-cord dummies? And white people intellects? You're
fuckin' out of your Goddamn mind!!!

his 12 volts are 14.5 charging, to me he has a 14.5 system
i can take a 12 volt battery and charge it at 20 in a keydown for 10
seconds...
To me, it is what voltage you charge at that determines what system you
have...

The Texas Rangers don't have illuminated dials or faceplates (yet). Also
the 396 & 696/699 series are the "Top of the Line", with the new design board,
while the 296's are essentially 148/Grant clones.....

You can still hook 2 deep cycle 12 volts together or 3 / 6 volts and volt that way..With big enough batteries you can key all day that way

I hope I did`nt brain my damage.

I`m not sure if thats true.How about it regulars..Black?.White?..I`m sure
you`re referring to the Keydown crowd but if you drive through West Virginia or
any other rural area you`ll see alot more CB antennas than in a major city

I hope I did`nt brain my damage.

Yeah, what's with all that crap on 6+11? When I go out towards the country all I can hear on almost every channel is a bunch of meaningless (I can't understand it) mumbling and a bunch of roger beeps.

I agree that 12 volts is not truly what volts the amp will see, but each time we refer to vehicles voltage system we would have to say 14 volt or 14.2 volts or 13.8 volts so I just refer to the batteries. You could charge at 20 on a 12 volt battery but it would be stupid, if he was going to run bigger volts he would have had the right batteries, trying to charge a 12 volt battery at 20 volts would eat up every bit of current a 200 amp alternator could provide. This would be almost impossible with one alternator if he had 4 12 volt batteries in-line, it would take more than one alternator.

> Hello, I have a few questions here:
>
1) I've been listening to all kinds of people talk, but I have yet for anyone to hear me! If I can hear them, and we're both running full legal power, why wouldn't they be able to hear my signal? Is antenna hight an issue? (I only have a 3' whip)

It could be that your antenna is small, and it could be because of the atmoshpere. It also depends on what the other part is using(ie. Cobra radio, Wilson antenna)
>
> 2) What, exactly, does "breaker" mean?

Breaker means that the person wants to break the channel so he can speak. If 2 people are talking and you want to speak, you say breaker breaker. Most people are nice and will stop talking and let you talk. It's just a friendly way of saying, "hey I wanna talk."

> 3) what is "skip" and why is it illegal?

When the conditions are right, a person can hear stations 150 miles + out. This is known as skip. Skip usually occurs when the sun does certain things. Also if there are a lot of clouds or something else in the atmoshpere, it will affect radio receiving.

Hey Guys,
I am almost afraid to post this for the flames, but I thot you'd like to know. On Uncle Jim's Message Board, there's a thread entitled "Is the FCC as bad as......" Seems that a little old lady complained that she couldn't watch her TV for the Truckers' BIG radios. This was at a truck stop near where I live AND nearer to the fellow who posted it. Seems FCC responded, hid in the "bushes", then set up a roadblock. They fined those with "illegal" stuff (amps, export radios, etc) $300 up depending on the offense. I suppose they had to have caught the offender "using" the stuff because they let a few go that had amps, but didn't have them hooked up. So I guess I have been hearing right, eh? They ARE out there. But it is consistent with there being a complaint lodged before they actually "nailed" anybody.

Now, I didn't post this to be a smart aleck. You can read it yourself on Uncle Jim's page. Just so everybody could read it for themselves. If somebody has UJ's addy handy please post it--I don't ahve it right in front of me.

Message-ID: <r7p55.29887$Q7.937849@news-east.usenetserver.com>
Source record: 41200

Yes... but how much you swing directly corelates to amplitude shift. Since the receiver is essentially looking for this amplitude shift... it means the more you have... the louder you will be at the receiving end. And in the end... it's the modulation that will get your signal through.

Hello Professor: Not always!

Granted that in most antenna installations, the coax length is only needed to reach the radio to the antenna. And SWR adjustment and tuning should be done at the antenna.

Your reasoning for having the shortest run of coax is based that the antenna can be adjusted for a minimum SWR, or the assembled antenna will have a acceptable SWR. Not always the case. And there other considerations on coax length.

Here's a example:

The MaCo V5/8, has owners having problems with high SWR at higher frequencies. And some of the equipment used will not allow the finial amp to go full throttle because of the high SWR seen. A longer length of coax is added to allow it's loss into the antenna circuit, which will add loss and increase the bandwidth, and reduce the SWR seen by the transmitter. This is not recommended by any one source, but its being done.

When a antenna installation has a very wide bandwidth, and the antenna has very bad SWR at some of the used bandwidth, adding a longer length of coax will again increase the loss in the antenna circuit, and lower the SWR. This prartice is used in some commercial and marine applications. But not many.

I like to have a few extra feet of coax coiled up just underneath the radio bench. This allows for the antenna to dropped down for repair or what ever, and if I move the radio, I have enough length.

Jay in the Mojave

Indefinitely

A teacher asks her class if anyone could use the word 'indefinitely' in a sentence. Well, Little Johnny has his hand raised in the back of the class.

But the teacher knows he's a trouble maker and that he doesn't know the answer, so she calls on Jim.

Jim replies, "Due to the weather, school was canceled indefinitely."
"Good" the teacher replies.
"What about you Jenny?"
Jenny says, "Since the bus broke down, transportation was stopped indefinitely."

The teacher then says that the sentence was too much like the other one, and she asks if anyone can use it in a different way. So there's Little Johnny waving his hand. And the teacher thinks ... (Maybe he really does know the answer), so she calls on him. Johnny stands up and says,

"As I felt my balls slap off her ass, I knew that I was in definitely!

I have a complete Demco Super Satelite system. This includes the transmitter, receiver, and the modulator. If you have ever looked it is quite difficult to find the complete 3 pieces in working order. It is in good condition and all 3 pieces work. I will be able to send pictures with in the next week. I will sell for 150$ plus shipping from 77520. or will trade for any kind of radio equipment please e-mail if you have anything to trade . tgnagy1@earthlink.net. If I do not sell in the next I will be putting it up for auction not sure which yet. Thanks and 73's from Baytown Tx.

Went to the site (userm.com) to check it out for information on getting back into hobby. Encountered 404 code "file not found". As a brand new person to this site, I am wondering if there is a FAQ page covering this group? Hate to get flamed for asking questions that have already been covered. If there is not a FAQ page, I would appreciate any helpful info on purchasing a new rig (in a very long time). Had an old Johnson Viking Messenger back in the early 60's!

Looking for a middle of the road set up to use while traveling. Don't see anything wrong with a few extra watts to help talk. Would kind of like some of the toys like echo, beep, etc. Thinking of a mag mount antenna, but have heard that they are easy pickings for thieves. I am sure this subject is asked time and time again, but I have been checking out web sites for days and the choices are endless. Galaxies appear to be a good choice to me with the 2 yr. warranty, but as a 53 yr. old ex (retired) Navy man I value other's opinions and experience over hype any day. Thanks for the help.

I tell people to go to the LOCAL Electronics PARTS store instead of the RAT. I have been turning people away from Rat Shacks since '72. DO you have questions? Only your LOCAL CB & Parts shops have answers and NOT the Corporate McDonalds Rat Shacks selling Red Chinese JUNK! You see, when you go to McDonalds looking for a steak, you just find 99 cent heart attacks. This is what you do when you to to the RATS. They may of had some CB's made by Uniden in the good old Classsic CB days, but the rats have come in and you get rat poison NOW. I have sprint--I got it @ the Sprint store, not at a rat hole!!!!!!
Dave!!!!!!!!!!!!!!!!!!!

Daniel Friedrichs wrote in message <3955760B.637E799@willinet.net>...
Oh, I agree completely. Although everyone at radio shack probably is more interested in selling expensive stuff, I can remember when they were alot better
at actually helping people!

>like some of the toys like echo, beep, etc.

What you describe puts you in the Galaxy 44 ($240) or 66 ($280) category That's avg price including convesion and tuneup, bang for the buck with the features you describe.

>Thinking of a mag mount
>antenna, but have heard that they are easy pickings for thieves.

Wilson 5000 mag mt. is your best money spent (about $90), and you can unscrew the top off if in undesireable areas.

This socalled "keydown" was a joke, and if they were trying to compare carrier level results, should've used same antennas.

I was talking to a guy the other night who was using a radio that i have never heard of before.

When i made the comment that the FM in it sounded pretty good and asked him what he was talking on he told me it was an Alpha Force Magnum 10 meter radio.

Anyone else heard of these? Specs...etc.

7455. More questions

Hello,
I have a few questions here:
1) I've been listening to all kinds of people talk, but I have yet for anyone to hear me! If I can hear them, and we're both running full legal power, why wouldn't they be able to hear my signal? Is antenna hight an issue? (I only have a 3' whip)

2) What, exactly, does "breaker" mean?
3) what is "skip" and why is it illegal?

Thanks,

--

The Alpha Force is a 10 meter radio. It has AM/FM/CW(mores code). It has a big LCD display. It is a really nice radio. I have the next version up from the Alpha Force. I have the Delta Force which is the same type of radio, but it has SSB.

It could be that your antenna is small, and it could be because of the atmoshpere. It also depends on what the other part is using(ie. Cobra radio, Wilson antenna)
>
> 2) What, exactly, does "breaker" mean?

Breaker means that the person wants to break the channel so he can speak. If 2 people are talking and you want to speak, you say breaker breaker. Most people are nice and will stop talking and let you talk. It's just a friendly way of saying, "hey I wanna talk."

> 3) what is "skip" and why is it illegal?

When the conditions are right, a person can hear stations 150 miles + out. This is known as skip. Skip usually occurs when the sun does certain things. Also if there are a lot of clouds or something else in the atmoshpere, it will affect radio receiving.

OK... here's my challenge. Find me the site where I allegedly stole the
pictures of that amplifier.
Bet you can't!

Well, I really don't feel RACE is relevant, what the hell does it
matter if I or anyone else is BLACK, WHITE, YELLOW, RED, Whatever!!

> what does this mean?

It simply means your attempting to stir up the users here, and are
assuming that because a person uses an amplifier, or posts messages
regarding "SUPER BOWL" that they are mindless and black... This NG
has posters who rate from a low of: Blittering idiots, to a high of:
Intelligent, thoughtfull individuals! And most everything in between!
I doubt this NG has a higher occurrence of white or black members than any
other NG.

>
> and why is the usual talk (if thats what you call it)

>
> Is there any actual conversation going on at these channel locations?
> or is it just a bunch of guys yelling repeated phrases over and over
> to see gar far they reach and how loud they can be?

LOL< this one makes me laugh!! Above are you describing the CONTESTS
held on the HAM BANDS??? Do you realize that you are describing the
fellows rambling over, and over, CQ CONTEST???? When you listen in on
6,11,12, or many other CB Channels your listening to basically the same
thing! And are probably referencing these frequencies when DX is in.
Granted it is a different vocabulary, and method, but idealology is the
same!! People of all Ethnic heritage Enjoy talking DX! Sure majority
wise i guess the channels you mention are Ethnic majority of Black folks.
However plenty of white folks do frequent these channels. Our society is
still not completely blind to Ethnic backgrounds, It may never be!! You
are certainly a prime example of that! If you don't care for a particular
channel just don't let your radio stop on it!

>
> On SSB and ham bands I hear actual conversation not just "Top Me"
contests
> like on CB.
>

Well on SSB, i hear a mix of everything from folks trying to talk DX, to regular conversation held on a regular basis, You are taking a few CB channels and comparing them to many! What do you hear on 19????? Some channels are typical of one type of communications, that in no way, says that everyone who communicates on said frequencies never hold a regular conversation.

> what do you think?
> I'm not taking sides just trying to figure out the diffrence here.
>
> Just currious.
>
>

I think you've already decided, I think, you are certainly a Racist! Now don't get me wrong, there are actually VERY FEW people who are NOT racists, to one extreme or another! This is an unfortunate fact of our Society! And there are Racists in ALL ethnic groups, Black as well as White! I was raised in a Racist family, its just a fact! My parents did not do this intentionally, nor were they Practicing Racists, they were also raised in a Racist family... I really try hard to judge a person by there actions not by Ethnic heritage! Good and bad exists everywhere! I really feel Race issues have no place here on the internet! I happen to be White, and an Extra Class Ham, however if i did not make this statement you would never know! This could be made up, you don't know! You can only judge me by my words! you can certainly not tell my ethnic heritage by my comments!! I think this only reinforces my statement! Race issues have no place here! I'm sure they will continue to surface, here and in every day life, however I for one, will do my best NOT to allow it to dictate my life....

not sure of the dimensions you need for the stingers, but possibly get one from k40, or Wilson, if those are too small, how about cutting one from a 102 whip... they taper nicely, and most likely would offer the correct diameter at some point, as long as that point were still long enough! If that fails how about www.davemade.com

Sarge, i was referncing Knight patrols comment regarding crap on AM, he is a 2510 kinda guy! i hate the 2510/2600 radios! i was making a sarcastic (all in fun) comment about the 2510! The Yaesu is a great radio for an entry level HF rig! the price you are selling yours for is more than fair! and should be a bargain for someone!

LOL, Dave one of the really COOL thing about our NON-COMMUNIST country!

No matter who does NOT like it! No matter How dumb they are!! Just plain, and simple!! NO MATTER WHAT!! we all have the right to FREEDOM OF SPEECH!! This DOES pertain to "YOUR NG" as well....

Just think without this inalienable right, we would be unable to read your SPEWINGS!

rg-59 is your best bet...it comes close to matching the
impedance of the system....I would think 100 ohm coax would work
the best. don't know if they even make such a thing...
anybody know?

Hello Jeff: Coiling up the coax will not add any loss to the coax cables insertion loss. The inductance will add on the outside conductor of the coax shield, no big thing.

I have measured several hundred feet of coax in a 2 foot coil on a Network Analyzer and measured no addition insertion loss, in a coil, or laid out in a straight run.

I have 2 votes. The absolute worst radio I've ever heard/worked on/used were Sharp radios. A friend of mine had a Sharp SSB that sounded horrible, and had crappy recieve. Every Sharp AM radio I've ever tried to make talk, just sucks. They have lousy audio, and won't do much power. If you drive the crap out of them with a power mike, they are at least as loud as a stock Cobra 19+.

I also have a beef with Johnson solid-state radios. I've only has experience with the AM ones, but they just all around suck. No audio, weak power, and no rejection at all. The only thing good about owning one (a Messenger 250) is that I can freely announce that I'm pulling out my Johnson to play with it, and not be perverted!!!!

Better at what stand point?

Cobra 29LTD - Good modulation, power capable of injecting a different signal
using a Colpitts
Cobra 29XLR - Could have better modulation and getting power from it could
be easier though its PLL can be modifified
Cobra 29GTL - As far as -my- work on 29's sounds a little better than the
LTD and its "tuning" can be open like a clarifier

They all have their ups and downs... I myself cannot stand for the XLR..
but..

Hi, I have a few questions about an older Uniden Grant I just purchesed.
It is simply called Uniden Grant.
The PC board has the following ID : PC 409 AC.

Can the mods and tuning described for the XL model be used for my
model ?
Also,
The output power on SSB never peaks more than 6W on an RF meter.
Turning VR11 doesnt help either.People reckon I sound terrible on SSB
with the mike gain on full but sound better when turned way down. This
only gives me 2 W peak!
AM sounds good on full mike gain. 4W carrier with VR 10 turned right up.

What could be the problem ??

Sent via Deja.com http://www.deja.com/

Thank you.

all prices listed below, shipping is seperate

Forsale, RG99 made by Ranger. 10,11,12 meter radio

>if you never seen one, it looks like the Pres. Jackson export

has 12 bands, including all the skips, AM.FM,USB,LSB,CW
All that is included; Astatic Power Mic, Galaxy Freq. Counter,
mounting hardware, bracket and power cord.
If you purchased all of the above new.. you would spend $370

your cost .... $200..

==========
SuperStar 121
120 channel AM/FM, 40 low, 40 med, 40 hi.
hi-lo power. and stock mic and power cord
sorry no mounting bracket
your cost.........$110..

==========
Cobra 25 LTD 40 channel
includes stock mic and power cord
no mounting bracket

your cost.....$55..

==========
Uniden Pro 510xl
40 channel

your cost......$30..

==========
Astron Power Suppy VS-50M
Dual metered, Dual variable controls
heavy duty heatsinks both sides of power supply
37 amp continous with a 50 amp surge.

your cost ...... $190..
==========

I live in the Garland, TX area.

Shipping is extra, sorry no COD's

accepting cashiers checks and postal money orders only.

item will ship same day payment arrives

no offers will be accepted, all prices are firm !

interested? drop a email

This coax is used in circuit? Or are you talking about extra coax? Just curious why you would make an inductor out of coax.

Don't waste your money, or time. Co-phasing antennas is
a loosing proposition. What you might gain (in only two
directions), you'll loose because of your trailer and
probably mismatching.
The gain you get with co-phasing antennas on a truck is
very slight to start with. With the trailer, traffic, etc,
the directional pattern isn't anywhere close to what you
may think it is, it get's 'skewed' all over the place. but
the antenna and coax people will just love to see you comming!

Well the guys I hear on 6 use slang which I hear a lot of blacks use in the Rap/Hip-Hop circles. I really do think they are black when I hear their voice. And it doesn't matter, just mindless ramblings. I used to wonder if it's just a person on speed or what. Then after I kept hearing it, I guess it's just a game.

Your a fool. Why don't you call everyone who states something that seems to be a fact a fool. Every time I listen to Chan. 6, I heard some black guy, yes I am saying that the voice sounded like a person of African descent. More of the hip hop culture. Should I call my friend from L.A. a racists and say he is color blind for telling me that certain groups use certain channels on CB. From what he told me hispanics use one, Asians use another, etc. Please get over the race issue. There is nothing here that is negative at all. All the ham users I know are white, that's plain fact. Chances are this guy may not know a black ham user. However, it's easy to see that blacks use CBs as do whites, even thought I don't agree they use them anymore or less. I just say this due to the number of black truckers there are.

> If you don't care for a particular channel just don't let your radio stop on
> it!

Right, but even I have wondered why these people talk the way they do. Really, I thought it was some channel that truckers on speed used, white or black. Then it became apparent that from what I hear, it's mostly black men talking. If you don't believe this white/black talk then go and watch some more Ricki Lake, she seems to agree with you. I think you've already decided, I think, you are certainly a Racist!

> Now don't get me wrong, there are actually VERY FEW people who are NOT

Some more name calling just cause this guy posted his observations via his hearing. Damn, you must sure have a problem fearing people will think your a racist unless you call this guy one. Get over it. I guess you would rather have those militia posts about blacks ruining the world? This guy/girl said nothing wrong in my opinion.

: BINGO!!

It was, by the original definition. Unfortunately, it was never adhered to by the receiver manufacturers, who did not want to spend the money necessary to calibrate an S-meter over the large signal level range that the meter covers.

These days, partly to make the CBer happy, one S unit is closer to 3 dB.

Here is the info you seek

Illegal CB Transceiver List
The FCC's Office of Engineer and Technology (OET) has evaluated the devices listed below and has concluded that these devices are not only amateur transceivers but can easily be altered for use as Citizens Band (CB) transceivers as well. As such, OET has further concluded that these devices cannot legally be imported or marketed within the United States for the reasons discussed below. Further, the FCC General Counsel has issued a decision in a specific case involving one manufacturer and has concluded that dual use CB and amateur radios of the kind at issue may not be approved under the Commission's rules and are in violation of several rules including the RF power level limits of 47 CFR 95.639. (letter from Christopher J. Wright, FCC-OGC to John F. Atwood, US Customs Service, dated May 17, 1999).

Transceivers used in the Amateur Radio Service below 30 MHz do not require FCC authorization prior to being imported into or marketed within the United States, but transceivers for other services, including the CB Radio Service (CB), do require Commission approval. The transceivers listed herein and other similar models operate in the amateur "10-meter band" and are often referred to as "10-meter" radios or "export" radios. The amateur 10-meter band uses frequencies that are very close to the channels set aside for use in the CB service. Some of the transceivers that manufacturers call "10-meter" radios either operate on CB frequencies as manufactured and imported or are designed such that internal circuits can readily be activated by a user, a service technician or a dealer to operate on CB frequencies. According to Section 95.603(c) of the Commission's rules, a CB transmitter is a transmitter that operates or is intended to operate at a station authorized for the CB service. 47C.F.R. § 95.603(c). The Commission's equipment authorization experts in the FCC Laboratory have determined that the transceivers listed herein and other similar models at issue here are intended for use on the CB frequencies as well as those in the amateur service because they have built-in capability to operate on CB

frequencies. This capability can be readily activated by moving or removing a jumper plug, cutting or splicing a wire, plugging in a connector, or other simple means. Thus, all the transceivers listed herein and similar models fall within the definition of a CB transmitter. See 47C.F.R. § 95.603(c). A CB transmitter must be certificated by the FCC prior to marketing or importation. 47 C.F.R. §§ 95.603(c); 2.803.

Moreover, the dual use CB and amateur radios of the kind at issue here may not be certified under the Commission's rules. Section 95.655(a) states: ". . .([CB] Transmitters with frequency capability for the Amateur Radio Services . . . will not be certificated.)" See also Amendment of Part 95, Subpart E, Technical Regulations in the Personal Radio Services Rules, FCC 88-256, 1888 WL 488084 (August 17, 1988). This clarification was added to explicitly foreclose the possibility of certification of dual use CB and amateur radios, see id, and thereby deter use by CB operators of frequencies allocated for amateur radio use.

In addition, the Commission's equipment authorization experts have determined that the devices violate or appear to violate a number of the rules governing CB devices. For example, they may use emission types not permitted, or emit RF power at a level in excess of the levels permitted in the CB radio service. See 47 C.F.R. § 95.639.

In view of the foregoing, the following "10-meter" transceivers are not acceptable for importation or marketing into/within the United States. Importation and marketing of these units is illegal pursuant to Section 302(b) of the Communications Act and Section 2.803 of the rules. Willful violations of the Rules and the Act may subject the violator to a monetary forfeiture of not more than $11,000 for each violation or each day of a continuing violation. The Commission continues to review this type of equipment, and additional makes and models may be added to this list in the future.

LIST OF TRANSCEIVERS
ILLEGAL TO IMPORT OR MARKET
GALAXY - models: DX33HML, DX 44V, DX55V, DX66V, DX 73V, DX 77HML, DX 88HL, DX99V and Saturn Turbo

CONNEX - models: 3300, 3300HP-ZX, 3300 PLUS and CX-3800

MIRAGE - models: 44, Galaxy 88, 9900 and 2950EX

NORTH STAR - models: NS-3000 and NS-9000

PRESIDENT - models: Grant, J.F.K., Jackson and Lincoln

PRO STAR - model: 240

RANGER - models: AR-3500 and RCI-2950

TEK - model: HR-3950

UNIDEN - models: HR-2510 and HR-2600

SUPER STAR - model: 121

For further information concerning the listed transceivers or similar models, contact Ray LaForge, or Gary Hendrickson at the FCC Laboratory, 7435 Oakland Mills Road, Columbia, MD 21046, (301) 362-3041 and 30433 respectively or E-mail: rlaforge@fcc.gov and ghendric@fcc.gov

Well since the Grant and Lincoln models have been banned by the FCC I
suggest you change your price list.
Read below

Illegal CB Transceiver List
The FCC's Office of Engineer and Technology (OET) has evaluated the devices
listed below and has concluded that these devices are not only amateur
transceivers but can easily be altered for use as Citizens Band (CB)
transceivers as well. As such, OET has further concluded that these devices
cannot legally be imported or marketed within the United States for the
reasons discussed below. Further, the FCC General Counsel has issued a
decision in a specific case involving one manufacturer and has concluded
that dual use CB and amateur radios of the kind at issue may not be approved
under the Commission's rules and are in violation of several rules including
the RF power level limits of 47 CFR 95.639. (letter from Christopher J.
Wright, FCC-OGC to John F. Atwood, US Customs Service, dated May 17, 1999).

Transceivers used in the Amateur Radio Service below 30 MHz do not require FCC authorization prior to being imported into or marketed within the United States, but transceivers for other services, including the CB Radio Service (CB), do require Commission approval. The transceivers listed herein and other similar models operate in the amateur "10-meter band" and are often referred to as "10-meter" radios or "export" radios. The amateur 10-meter band uses frequencies that are very close to the channels set aside for use in the CB service. Some of the transceivers that manufacturers call "10-meter" radios either operate on CB frequencies as manufactured and imported or are designed such that internal circuits can readily be activated by a user, a service technician or a dealer to operate on CB frequencies. According to Section 95.603(c) of the Commission's rules, a CB transmitter is a transmitter that operates or is intended to operate at a station authorized for the CB service. 47C.F.R. &#65533; 95.603(c). The Commission's equipment authorization experts in the FCC Laboratory have determined that the transceivers listed herein and other similar models at issue here are intended for use on the CB frequencies as well as those in the amateur service because they have built-in capability to operate on CB frequencies. This capability can be readily activated by moving or removing a jumper plug, cutting or splicing a wire, plugging in a connector, or other simple means. Thus, all the transceivers listed herein and similar models

fall within the definition of a CB transmitter. See 47C.F.R. § 95.603(c). A CB transmitter must be certificated by the FCC prior to marketing or importation. 47 C.F.R. §§ 95.603(c); 2.803.

Moreover, the dual use CB and amateur radios of the kind at issue here may not be certified under the Commission's rules. Section 95.655(a) states: ". . .([CB] Transmitters with frequency capability for the Amateur Radio Services . . . will not be certificated.)" See also Amendment of Part 95, Subpart E, Technical Regulations in the Personal Radio Services Rules, FCC 88-256, 1888 WL 488084 (August 17, 1988). This clarification was added to explicitly foreclose the possibility of certification of dual use CB and amateur radios, see id, and thereby deter use by CB operators of frequencies allocated for amateur radio use.

In addition, the Commission's equipment authorization experts have determined that the devices violate or appear to violate a number of the rules governing CB devices. For example, they may use emission types not permitted, or emit RF power at a level in excess of the levels permitted in the CB radio service. See 47 C.F.R. § 95.639.

voice.
> And it doesn't matter, just mindless ramblings.

FIRST: let me say i have no problems with the South, lol!

LOL, well myself being an UP-North Yankee, I guess your argument may have some merit! Granted it can be difficult to understand, and can almost be considered another language.... But as hard as it may be for you to comprehend White people do sound like that! If you get into some of the Southern states A large number of "men" white and black can sound exactly how you here it on 6, Silly? Mindless? who am i, or you to judge? Some of the "BOWL" crowd even throw on some heavy accent for dramatics! I talk to a number of the "Bowl" crowd off the "Bowl" and in person, You simply would NOT recognize them! Some there is no mistaking!

I used to wonder if it's just a
> person on speed or what. Then after I kept hearing it, I guess it's just
a
> game.

I hear plenty of Short contacts, as well as meaningfull communications! You know 15-20 years ago, I was totally unable to understand most of the communications on the Bowl! I don't know if there is a real difference now in how they sound or if i've just gotten "an ear" for it in my old age... Regardless i know what your saying... However as i said Blittering idiots come with every crowd!

>
> Your a fool. Why don't you call everyone who states something that seems
to be
> a fact a fool.

The Above Statement is lacking any type of logic! Seems a fact??? If we believe everything that seems to be "FACT" WE WOULD INDEED BE FOOLS!!!!!!! This can be referenced as far back as when the world was "FLAT" you may indeed remember those days!! As your thinking is as archaic as that statement!!

Every time I listen to Chan. 6, I heard some black guy, yes I am
> saying that the voice sounded like a person of African descent. More of
the hip
> hop culture.

AHHH..... Indeed the KEY-WORD above is "SOUNDED-LIKE"
make sure to read my first response where i explain how heavily accented
folks can be difficult to tell Ethnic heritage.....

Should I call my friend from L.A. a racists and say he is color
> blind for telling me that certain groups use certain channels on CB. From
what
> he told me hispanics use one, Asians use another, etc.

Actually that is a Racist remark..... Why would anyone need to know
what frequencies a certain Ethnic group resided on? Chances are your
buddy as well as the Ethnic group on the CB are Racist to one extent or
another...

You realize when YOU make a statement like"I have nothing against Blacks,
I have a Friend who is Black!" it is a racial statement... The politics
Of racism can make your head spin! I know, I unfortunately am married
to a Racist, and a participating WHITE POWER member! Believe me I'm not
proud of this! I'm trying to change the situation! Racism is an
unfortunate DISEASE that is deeply rooted in our country!

Please get over the race
> issue.

I'm seriously trying!! Unfortunately living in a rural setting like i
do, it is difficult!

There is nothing here that is negative at all. All the ham users I know
> are white, that's plain fact.

LOL, there you go, are you insinuating ALL HAMS are WHITE? If you were
to encounter a Black Ham would he get as polite, and warm welcome as a
"WHITE" ham? Since all Hams you know are white you can only answer with an
opinion, rather than a fact!

Chances are this guy may not know a black ham
> user.

Yes this could indeed be FACT! I've found that ALL of the Black HAMS I
know are quite practiced and proficient with speaking in a way that
completely hides there heritage!

>However, it's easy to see that blacks use CBs as do whites,

LOL, Carefull your letting the fact that your another Holier than thou ham
slip out!!!!

even thought
> I don't agree they use them anymore or less.

Why is it "THEY" "THEM" believe me i've listened to folks attempt to supress racism before! You might not even admit it to yourself but you certainly ARE a racist!

I just say this due to the number
> of black truckers there are.
>

Hey Guess what, In my years of various employment, I drove truck! Actually done a bit of everything from Operating Heavy Machinery to Computer Programming/consulting.... When i drove truck, and even now my knowledge of Drivers tends to make me believe black drivers are a minority....

What exactly are you attempting to get acrossed? in your above statement??? that black truckers are a majority representation of CBer's? Or that the majority of truckers are black CBer's???? please elaborate??

> Right, but even I have wondered why these people talk the way they do.
Really,
> I thought it was some channel that truckers on speed used, white or black.
Then
> it became apparent that from what I hear, it's mostly black men talking.

Here you go again! "These people" "They" VERY RACIST!!!

White or black, southern accent or not! The folks on "THOSE CHANNELS" understand each other and DO COMMUNICATE! perhaps your lack of understanding is a handicap, or perhaps not......

If you
> don't believe this white/black talk then go and watch some more Ricki
Lake, she
> seems to agree with you.

Well I really have no comment on this one, I watch very little TV and have no iea who the Hell Ricki Lake is! Yeah, call me sheltered..... I would guess that by your inuendo that it is a SHE who has as many friends of African American Heritage as Caucasion.... Another point for you to enlighten me on....

> Some more name calling just cause this guy posted his observations via his
> hearing. Damn, you must sure have a problem fearing people will think
your a
> racist unless you call this guy one.

He is, and so are you! And i have already admitted I'm a racist, And trying damn hard to recover from it! All the years of growing up, the racial slurs of my friends..... the whole works! The difference is I've admitted this fact and am sincerely trying to overcome the years of programming by my peers!

Get over it. I guess you would rather
> have those militia posts about blacks ruining the world? This guy/girl
said

> nothing wrong in my opinion.
>

I'm attempting to get over it! IF you have/had any children how would you feel if they married a NON-WHITE individual???

Take a deep and truthfull look at yourself before you choose to judge others!
Our Country was, is, and always has been a racist entity! It has not been all that long since SOME FOLKS have made an attempt to change those facts! I have seen first-hand violent racism, initiated by Blacks as well as whites.... A racist is a racist no matter what color and how hard they try to hide the facts! I've resorted to no name calling, calling you a racist is not an attempt at insulting you! Although you have chosen to insult me! My opinions are MY OPINIONS, right or wrong, I have the right to respond, or ignore any posts i see fit! At the moment I'm not here attemting to cause problems! Give me a post or two to warmup! My opinions may or may not be supported.... It really does not matter..... IMHO black or white, we all have seperate opinions, ethnic origins, and characteristics. As it should be! however i think the differences should end there. I would prefer to be judged by my actions rather then my color!

I will continue this Debate in private, This WILL BE my final public post regarding Racists and Racism! I refuse to carry it any farther! You may continue to call names, and insult me. You will NOT get a public answer!

Ahhh, you've changed NOTHING! I've had 10 meter amplifiers pulled
from Ebay auctions, because of idiots like you! The ONLY THING you've
acomplished is a nuisance! Your kind made Ebay become particular about the
wording of the auctions! They don't give a Sh#t if its a CB Linear, or a
Ham linear! if it gets complained about by someone like yourself, and the
wording is not AGREEING to Ebay policy criteria they kill the auction!! If
the wording is to Ebays approval ALL YOUR WHINING AND CRYING will make no
difference! Even if the the amp is a GOOD BUDDY FOOTWARMER!! The sale
will go on!! Whiners have tried since the beginning of the CB days to
curtail linear sales!! go to www.altavista.com search using keyword CB
or CB amplifiers! or anything like it! see how long it takes you to find a
place to buy from.......

So if this is true, what will be next??? how about the FT-100 or an Icom 756 Pro?? where will it stop?? what will be the criteria for deciding if the modification is to simple? The only thing that will be acomplished is a rethinking of the manufacturers! if they have to they will change the Rom to comply! then a week later a third party will appear with replacement Roms.... When will you Hambone's learn???? it is a futile effort!! you will just slow things a bit! if money is there to be made someone will supply the market! this would not be the first effort on the FCC's behalf to dry up the Export radio market! Not to mention the legitimate users of these radios!

> transceivers as well. As such, OET has further concluded that these
devices
> cannot legally be imported or marketed within the United States for the
> reasons discussed below. Further, the FCC General Counsel has issued a
> decision in a specific case involving one manufacturer and has concluded
> that dual use CB and amateur radios of the kind at issue may not be
approved
> under the Commission's rules and are in violation of several rules

including
> the RF power level limits of 47 CFR 95.639. (letter from Christopher J.
> Wright, FCC-OGC to John F. Atwood, US Customs Service, dated May 17,
1999).
>
> Transceivers used in the Amateur Radio Service below 30 MHz do not require
> FCC authorization prior to being imported into or marketed within the
United
> States, but transceivers for other services, including the CB Radio
Service
> (CB), do require Commission approval. The transceivers listed herein and
> other similar models operate in the amateur "10-meter band" and are often
> referred to as "10-meter" radios or "export" radios. The amateur 10-meter
> band uses frequencies that are very close to the channels set aside for
use
> in the CB service. Some of the transceivers that manufacturers call
> "10-meter" radios either operate on CB frequencies as manufactured and
> imported or are designed such that internal circuits can readily be
> activated by a user, a service technician or a dealer to operate on CB
> frequencies. According to Section 95.603(c) of the Commission's rules, a
CB
> transmitter is a transmitter that operates or is intended to operate at a
> station authorized for the CB service. 47C.F.R. § 95.603(c). The
> Commission's equipment authorization experts in the FCC Laboratory have
> determined that the transceivers listed herein and other similar models at
> issue here are intended for use on the CB frequencies as well as those in
> the amateur service because they have built-in capability to operate on CB
> frequencies. This capability can be readily activated by moving or
removing
> a jumper plug, cutting or splicing a wire, plugging in a connector, or
other
> simple means. Thus, all the transceivers listed herein and similar models
> fall within the definition of a CB transmitter. See 47C.F.R. § 95.603(c).
A
> CB transmitter must be certificated by the FCC prior to marketing or
> importation. 47 C.F.R. §§ 95.603(c); 2.803.
>
> Moreover, the dual use CB and amateur radios of the kind at issue here may
> not be certified under the Commission's rules. Section 95.655(a) states:
".
> . .([CB] Transmitters with frequency capability for the Amateur Radio
> Services . . . will not be certificated.)" See also Amendment of Part 95,
> Subpart E, Technical Regulations in the Personal Radio Services Rules, FCC
> 88-256, 1888 WL 488084 (August 17, 1988). This clarification was added to
> explicitly foreclose the possibility of certification of dual use CB and
> amateur radios, see id, and thereby deter use by CB operators of
frequencies
> allocated for amateur radio use.
>

> In addition, the Commission's equipment authorization experts have
> determined that the devices violate or appear to violate a number of the
> rules governing CB devices. For example, they may use emission types not
> permitted, or emit RF power at a level in excess of the levels permitted
in
> the CB radio service. See 47 C.F.R. ? 95.639.
>
> In view of the foregoing, the following "10-meter" transceivers are not
> acceptable for importation or marketing into/within the United States.
> Importation and marketing of these units is illegal pursuant to Section
> 302(b) of the Communications Act and Section 2.803 of the rules. Willful
> violations of the Rules and the Act may subject the violator to a monetary
> forfeiture of not more than $11,000 for each violation or each day of a
> continuing violation. The Commission continues to review this type of
> equipment, and additional makes and models may be added to this list in
the
> future.

I have three items for auction that all have buy prices on Yahoo.
they are under seller name fiveonemobile.
they are:
Cobra 148FGTLDX+ radio 12 bands am,fm,usb,lsb,cw ...very good to excellent
Bulldog 600 amplifier 2 x 4 transistor amp.. very good condition
Dave made 2 x 4 brand New never keyed except on test bench when bought.

If interested you may go to Yahoo auctions or e-mail me
thanks

GTL is the best. I have one that deadkeys around 2 watts and swings up to
25 watts. Very nice radio.

There is always someone who has got to keep poison going.

Let us not come down to their level.

When we use the English language with 4 letter words that have no meaning what so ever in the context of the message then we are bringing ourselves black, white, green, yellow or tan down to the persons level who started this.

I would have let it go and not posted but Someone in this string Used the lords name in vain. That is inexcusable.

God Bless you all who ever your god may be.

7582. Newbie CB guy here, antenna probs!

Newsgroup: rec.radio.cb
Date: 2000-06-26 00:00:00 UTC
From: CoyoteBoy <j.buckle@btinternet.com>
Message-ID: <8j7q0j$la2$1@uranium.btinternet.com>
Source record: 41355

Howdy guys, I've just been given an amstrad CB, it came with an antenna that looked like every other one I've seen, it's about 3.5 to 4 foot long, made of steel (looks like, definitely not fibre glass) and has a spring at the bottom of it. As far as I can remember from A level physics, I need the main piece of the antenna to be separate from the spring/outer section ofthe connector. The inner pin at the bottom appears to be insulated from the outer. Inside the spring I can just make out what looks like braided cable, maybe 2. Should these touch the sides of the spring?
How can I test this antenna with a normal digital or analogue multi-meter? Surely the inner and outer ofthe connector should be separate, or else the signal would not cause a variation on electric field strength across the 2 points and therefore give a signal.
I can get some very local conversations with it, I have not adjusted the length (It can be adjusted using a small allen bolt). I dont have a signal meter, and am on a budget - so basically I need to know how I can get this up and running without spending more cash than necessary. I have no idea how powerful the unit is, it's a mobile unit about 25cm square by about 5 cm deep. It's an Amstrad, and relatively old.

If you can help please email me at j.buckle@btinternet.com, I cant check NG's very often.

Thanks very much, I'd really like it set up for when I go on holiday on July 15th.

Thanks for the information there, Hambo. After going back and rereading the law, here is what I found to be the defining loophole that allows the distribution of said radios. As far as banning them, I do not believe that ever took effect, for they continue to flood the market and are easily accessible. It does appear as they attempted such, but missed the boat. Notice it says "illegal to market/import within the United States". It does not specifically address the actual act of "exporting" a radio. Therefore, if a company outside the United States does the actual importing to a company stateside whose stated sole objective is to export these type radios, it appears they are still within the law. A gray area that will probably be tested in the courts IF the Feds. ever decide to aggressively enforce the law. Disclaimers abound among distributors that state the purchaser will use the item for export or use outside the U.S. This allows the radios to continue being readily available.

Hello all,
I was wondering if someone could help me out here :)
I recently lost my schem. sheet for my 2950. I have managed to map together some of what I already knew. However, I need to know what the following do...
VR-8
VR-2
VR-1
VR-21 (I think it is)

Anyone's help would be incredibly appreciated!!!!!!
Thanks in advance,
-Jeff,

Woody! Bingo! That was it! Thank you VERY much. I bought one of these
at the rip old age of 14 from Freck Radio in Ashville, NC, right around
1971. It had a slider modification. When I got it home, I had reports
of either distortion or off frequency operation (no matter where I
positioned the slider). Not knowing the ropes, I had to return it,
which Freck greatfully did. What a radio. Now, it's patiently wanting
to find one! Neat website...thanks, John

Message-ID: <8j83h2oqu1@neptunium.btinternet.com>
Source record: 41361

I have the unit here, it is an Amstrad CB 901. It's got a little circle near it's logo the has CB 27/81 in it. It has 40 channels (1 to 40)

A pic I took of it is here, sorry about the quality!
www.btinternet.com/~j.buckle/image1.jpg

Masses of questions, sorry!

Main one, my dad said it is illegal to use this CB (In the UK) as it is AM. Is it (AM or illegal??) He said that when he was younger they used to get chased by the police and have their cars confiscated for using them! I really need to know this one!

Some smaller questions:

It has a small button on the back that says 10dB ATT on/off - what does this do!?!
Also, what does the ROG push button do?
What wattage is it?
Do I presume that the ground connection at the case is a good enough ground for the antenna (who's co-ax shield bit, not the core) is not connected to the antenna, or the magnetic mount.
Is there anything else I need to know about the antenna/electrical setup/tuning of the antenna?

I have also got a 3ft fibre glass antenna in better condition and more easily mountable that came off another radio, should I use that instead? Are antenna's tuned for an individual unit, or generically for all CBs, provided same frequency used (shouldn't it be either 1/2 or 1/4 of a wavelength long? And if so, where do you measure from!?!?!?!)

Masses of qustions I know, but I dont want to spend forever setting it up, only to find I need to pull it apart again!
I have to have the magnetic mount as my car is left in Liverpool very often - even the bolts from the mount would get pinched if I left them showing!

Thanks again, and thanks for being so patient with me!
James Buckle

: The Moskal's <larry@sgi.net> wrote:
: I've asked this before and only got one response. I'll try again. How
: do you adjust the plate, load, and the knob in the back.
: Thanks alot

If you email me direct at the address below (which means, don't just hit your reply button) I'll send you an Email with a jpg of the original tuneup instructions. I get asked this question about once a month and finally just scanned the paperwork for it.

In short, the 300A is a two stage amplifier. Place the amp in the low power position, terminated into a dummy load/termination. Key the transmitter and quickly adjust the front panel tune and load for max indication on a power meter (or the front panel relative indicator). Unkey the radio...

Place the power selector switch in the high power position, key the radio and quickly adjust the rear tune cap for max output. Re-adjust the front panel tune and load controls for max forward power. Quickly repeat the above steps a few times.

Once The amplifier is tuned for max forward power into a termination, you may switch it to the antenna. If your swr (reflected antenna power) is low, you should be able to quick retune the amplifier for the antenna using the above one or two more times.

To make the amplifier linear (clean), the load control is then rotated a small amount to modify the amplifer operation. This is a very important step to the clean and proper operation of a Palomar 300a. Since I don't remember off hand which direction the knob needs to be turned, I'll have to go back and check the paperwork. If you Email me direct, I'll send you a copy of it and you can read it all for yourself.

Don't over drive the amplifier.... The real world is 4 watts am max on high power, about 40 watts am drive on low power. The low power position is just a bypass of the first stage. The second stage can be driven clean to 40 watts am.

cheers

: use but must work on SSB.
: Thanks,
: Richard.

Hi Richard,

As you can see, you've asked the million dollar question. You should already know by now that amplifiers are no longer allowed on the CB band. That doesn't stop a lot of operators from using/owning amps, it's just that they aren't legal to use there.

Since it's considered a grey market, you take a bit of a chance buying used or from the various people selling them... like here on the internet. If you look around here, you'll get to know people who are vending them or telling you where to buy them.

Old amplifier names no longer mean anything. A lot of the hacks making amps copy the original amplifier mfgrs name to make a buck. Only an honest and experienced tech can tell you what the real story is underneath.

cheers
skipp

I remember a few years ago, The FCC was hot and heavy after RCI!
Rumors abounded, Heard that a Multi-million dollar fine was levied.. The
only Fact i can confirm is that RCI indeed did have some legal problems!
Couldn't buy any from distributors, Yep the omni-potent FCC managed to shut
down RCI! it took RCI the better part of 3 months to recover! Then it was
business as usual! Then theres Texas Star! Rumors again were
plentifull! distributors told me most of the inventory was confiscated, was
a bit of a dry period! The Texas Stars were gone! took them i while but
yep guess what, some minor changes and back in business! Enforcement is
tricky for the FCC, they have to adhere to the laws, manufacturers, and
importers all are able to sidestep around the laws! This has been proven
to be fact! Since the beginning The amplifiers and devices to add Extra
channels have been here! And i doubt anything will change that.....

Ive lived out my C.B. ambition's (hobby) in two different places, the first an ideal location...up on a good size hill with a 60 foot tower with a 4 element Jo-Gunn (Star) 4+4, and secondly in a condo invironment not being able to put anything outside (an antenna) in my condo I made a 11 meter dipole, and tweaked it with an antenna tuner, and the antenna is in my 3rd floor bedroom closet. I dont need to tell you that id much prefer the tower/beam scenario BUT.....Its really not bad C.Bing @ my condo, so I really dont see the need for all of these big hi power amplifiers, Ive narrowed down my primary radios to a Tram D201 (like new cond) and a Tram D201A also (like new cond) and locally.....I talk just as good, so......why bother with all of the extra garbage that comes with running a linear? Just my opinion. Frank

Start complaining about those 2meter and 440 MHz radios that can be modified
for public service frequencies. Enough complaints will get some action and
these are more dangerous than some CB amps.

It must be in showroom condition. See http://pages.prodigy.net/classic48/trc.htm
and you'll see the price it got on Ebay. ($60.00)

BTW, I've got one and it cost me $10.00 and 1/2 hour to make it talk again.

You have to keep in mind that Griffey uses an old technique where
the carrier *increases* in step with the modulation percentage.
Therefore, when he speaks, his carrier amplitude (size) can very
well be larger than that of the person he's comparing his signal
to. That's the reason he only gets over the other guy when he
speaks.

In a real competition Griffey would have to use a constant tone
to hold up the carrier--otherwise he'd lose because he wouldn't
hold the tape for the larger percentage of the time.

Griffey's technique has been around longer than he's been alive.
Its most popular application was with early walkie-talkies. It
was used to conserve battery power--not improve communications
range or quality. Griffey stumbled upon it and has been milking
it and partially misrepresenting it as the only and best way to
go for the better part of 3 years.

Griffey lives in Illinois near Sean Foley and Dennis Ostrowski.
Both have offered to prove in a real-world comparison that his
suppressed carrier mod is not the best competition choice, nor
is it all he cracks it up to be. But, for some unknown reason,
Griffey never takes them up on it. Think about that.

Now, Griffey is pushing this recorded "comparison" where he
controls everything. Think about it. Is it fair and impartial?
No. Given that, does it have any value other than to boost
Griffey's ego? No. So, take it for what it's worth--nothing.

That's alot of bullshit that won't get you better results than
just tuning into the antenna for maximum MODULATED output using
the meter on the front of the amp. That's why the meter is there
and why it says "tune for max." The original tune-up instructions
say that tuning for maximum peak (modulated) output power is an
alternative to their wordy technique that has you tune for maximum
carrier and then over couple the plate load cap to compensate.

In the end, the instinctual response is to tune for maximum on
the amp's front panel meter anyway. You might as well learn how
to do that properly right from the get-go.

The flanges that stick out on the bottom on either side are
meant to be used for mounting. If they won't work, Radio Shack
sells a mounting kit (a bunch of brackets in a blister pack)
that will work. Just be careful with the drilling.

Source record: 41391

.....I have a friend that has a side piece on his base that will peak out around 1800-2200w..., He is running a Solarcon I Max 2000 antenna.., that is approx 65' to the tip....With 75' of RG213U coax....Trying to put as much info here that I know.
He's also got a Galaxy radio, but I can't recall which one (it is a base unit)..

He is having some problems with the neighbors, and hasn't turned the thing on since the last neighbor complaint.. (about 3 weeks ago..) I got on line with him here, and we found a 2500w TVI filter on www.vectronics.com ... How well will this thing do, on suppressing the interference?? Will he EVER be able to talk "with it on", at a decent hour?? Also I found a high-pass filter unit on MFJ's site (www.mfjenterprises.com) ...That could be
given to the neighbor (if he calms down!!!).......That could be put in line on his end..

My friend is not a "troublemaker", and as you could tell..., is trying in every way to correct the problem.. But the neighbor doesn't see it that way.Any suggestions??

Thanks in
advance......

Maniac "373"

P.S.......Id also like to further add that with a GOOD base radio, that has a good receiver in it and a good transmitter in it you can give just about anyone a run for their money in talking. I find it more challenging to be able to key over someone running a linear with poor, suffocated audio, and my audio cuts through it like a hot knife going into butter. Its a beautiful thing......I must say....(snickering) I cant count how many times ive frustrated the heck out of someone trying to key up over me and I end up busting through their carrier with my "God Blessed" audio machine TRAM D201/D201A.......once again.....its a beautiful thing !!!!! Frank

7620. LQQK @ THIS PLEASE.....LOOKING FOR.....

Hello all, As some of you already know from reading some of my posts, I am very into Tram radio's. Im looking for a Tram D201/D201A that is strictly a "parts" radio. It does not matter if its working or not, but it is important to me that the radio has ALL of its parts and features in tact. I already know about Maynard from "Maycomm" communication's, but his prices are totally outrages, and he does not sell parts only radios (even though he's going out of business) sounds silly to me too but he is a business man to the very end I guess. I dont have ANY problems with my radios at all, but I figure its only going to get harder and harder to find parts for these babies in another 5-10 years. I likewise have a friend who just recently purchased a D201, and he needs a few parts to get his up and running so it would be benifitting to him as well, if anyone has one and is willing to get rid of it please let me know at your convience, and I will give you a fair but reasonable offer. Thank's and 73, from Frank Sob 1682 SSB/Cobra 52 AM on ALL 40 channels of the world..........and im OUT.....!!!!!

Maniac9188,
The filters are a good start, if he just has to run an amplifier. There are a number of other things he can try, but the important thing is to calm the neighbor down. Your friend is on the 'short end' of the stick to start with, and will be there as long as he isn't 'legal'. (It doesn't matter if you like it or not, it's still ilegal, and as such, his 'end' of the stick has some 'odiferous residue' on it.)

This sounds like a mobile antenna, and if so, to
use it 'fixed' you will need some type of 'ground' or
radial system. (Other 'half' of the antenna)

>I have no idea how

It is a Digital PLL controller, The UFO series was programmable for various radios, it was made by Redco, The units frequency range was 24.995-28.305, in 5kc steps! I may be wrong on the freq. range, its been a while... There were other similar units, Commtron made one that was close.... Makes a neat addition to a vintage PLL controlled 40 channel radio.....

Is this a spring or a loading coil?

>As far as I can remember from A level physics, I need the main
>piece of the antenna to be separate from the spring/outer section ofthe
>connector.

If this spring at the bottom is indeed a spring and not a loading coil
then skip to 3. If it is a loading coil then read 1 thru 3

Not always. It depends on if the antenna is shunt fed or series fed.

1. If it is shunt fed then the feed point at the loading coil is
tapped part way up the grounded coil. It will show a DC short to
ground.

2. If it is series fed there will be a capacitor at the feed point
It is connected between the bottom of the loading coil and ground.
There will be infinite DC resistance with this feed.

3. There is on other method of feeding a antenna like this and that is
directly without any tuning network. It will also show infinite
resistance between center and ground.

>The inner pin at the bottom appears to be insulated from the
>outer. Inside the spring I can just make out what looks like braided cable,
>maybe 2. Should these touch the sides of the spring?

Doesn't matter. If this is a spring as opposed to a loading coil then
it will have a shorting braid inside to eliminate any inductance of
the springs windings.

Also if this antenna is for 27mhz and is only 4 feet long then there
must be a loading coil someplace. Is this a center loaded antenna with
a spring at the bottom?

>How can I test this antenna with a normal digital or analogue multi-meter?

Just check the DC resistance between ground and whip.

>Surely the inner and outer ofthe connector should be separate, or else the
>signal would not cause a variation on electric field strength across the 2

>points and therefore give a signal.

Again, not always.

>I can get some very local conversations with it, I have not adjusted the
>length (It can be adjusted using a small allen bolt).

Yes. Use the set screw adjustment and watch your SWR meter. Try to
get the best match you can. Anything under 1.7 :1 is good enough.

Much of the distortion comes from the AGC circuit in your receiver.
The radio will amplify the low carrier more then the high modulation,
and when the signal strength goes up, the AGC kicks in, reducing the
audio to the speaker. This constant AGC see-saw action causes distortion.

Cophasing is not to increase gain but to even out the radiation pattern. The radiation patten on a Simi with one mirror mounted antenna stinks, it may in fact have more gain than a cophased array but the signal is going crossways the highway. If the antennas are a good match to 50 ohms taken one antenna at a time 75 ohm cable is the way to go. If the SWR to one antenna is around 1.5 or more 50 ohm cable works just as good if not better. This is fairly common on a simi with center loaded antennas. Their feedpoint impedance often runs about 25 ohms, meaning you would see an SWR of 2 to 1 at resonance. This is the perfect case for using a 50 ohm harness instead of a 75 ohm one.

Sorry, Buckaroo, skip is NOT legal on 11 meters.

Skip is possible from a barefoot mobile. Saturday night, I stopped at a field day. I didn't want to splatter the hams from the parking lot, so I left the amp off. Took three tries to hit the Roosevelt base in PR instead of one. (No matter how clean your setup is, bleedover happens at 1000 feet! The 10 meter station was killing me, but it was his day, not mine.)

Buckaroo wrote:

From: cat <cat88@helicon.net>
Message-ID: <slfujm2fjev91@corp.supernews.com>
Source record: 41424

hi, I have notice that the reflector element on the moonraker has come loose, it is not always in the vertical, horizontal position (+), sometimes it is in the (x) position. my question is does the position of the reflector element have anything to do with performance of transmitting function of antenna, or just the rejection of antenna, thank you for info...73s craig

Yes it does effect performance, not as much as you might think but it does... both TX and RX..... It was a pretty common occurrence on the Raker 4/6 and the PDL II, The Cast hubs were definately the weak spot on them.... they broke easily, and left a little to be desired for holding strength.... I alays pinned mine to the boom with small self tapping screws, that way they could not spin....

That,s a bit much running through a ground plane. I don't think any type of filter is going to total fix his neighbor problems. I would suggest that your friend invest in some type of beam antenna; that way he would get the best bang for the buck and maybe he wouldn't have to use so much power.and still do more damage in DX.
Myself I believe it's a waste to run that much through a ground plane USE A BEAM ANTENNA.

The FCC has tried for years to kill the flow of these radios, i doubt they will have any better luck now-days..... It is possible they could temporarily halt sales, however its not likely....

> to put in my 31 chevy.

There were a few around, but you wouldn't want one, believe me.
It would be much easier to convert the '31 to 12 volts. All it
would require are a regulator and light bulbs. Yeah, I know it
wouldn't be 'stock' anymore, but if you were going to put in a CB
radio to 'use', then you evidently are driving it. Wouldn't worry
about the non-stock parts. I had the same problem with a '51 Ford
pickup, except it was positive ground (absolutely no way around that).
Changed the generator to an alternator, changed 6 light bulbs, and
forgot about it. Wanna make it stock again? Don't throw away the
bulbs or generator.

It was late, I was tired, (add other excuses here), and I
really didn't mean Zero-ohms, I meant 'infinite' resistance.
Really didn't mean zero... sorry 'bout that.

couldn't hear a name maby . only understand
" world wide chicagoland , bump bump " full pinning me from channel 8-15 bled over all the way round the dial . in aurora the signal came from the noth and east a bit .

imagine what your amp would do if you focused all that rf on one freq . turn your driver down . get some filter's or something .

imagine it like a garden hose , would you rather spray that water like a fan over your hole yard , or squirt one thin stream across the neibors house .

I have the following items for sale. Don't need them any more. Here we go...

1) 1 - 38" Custom made Whelen Edge bar. Includes - front - 2 directional strobes (twist lock relampable), 2 halogen flashers (twist lock relampable), and 2 180 degree end/corner strobes; side - alley's; rear - 180 degree end/corner strobes and 2 halogen flashers. Lo Pro Speaker included. The flasher is "hung up" on steady burn, so it
needs a new flasher, but steady burn actually works very well! ; power supply has less than
5 hours of use, 6 outlet, variable flash, new style Edge power supply. Red, clear, and amber lenses currently on bar. Asking $400 or best offer. Plus shipping.

2) 1 - Whelen Dual Dash Miser; Red/Red, less than 1 year old. Suction cup "Z" style mounting brackets. Asking $100 or best offer. Plus shipping.

3) 1 - Federal Signal compact siren; wail, yelp, manual, & air horn, 100 watts, 2 years old, but still works great. Asking $60 or best offer. Plus shipping.

4) 4 - Whelen 810 series surface mount linear strobe head's. These are the square "box lights" similar to those on an ambulance. Lenses are currently split Clear/Amber. Replacement lenses are around $20. Asking $60 each, or $200 for the lot of 4, or best offer. Plus shipping.

5) 1 - Motorola STX converta-com. Includes wiring harness and palm DTMF / Display mic. Asking $150 or best offer. Plus shipping.

6) 3 - 100 watt siren speaker's. Comes with driver and mounting bracket, 1 or 2 might have the bell and cone also. All are in working condition. Asking $50 each, or $125 for the lot of 3, or best offer. Plus shipping.

7) 1 - Whelen 2 outlet single flash power supply. Not sure on the watts, but the flash is very bright. $30 plus shipping, or best offer.

8) 1 - Whelen WS-295 Siren, less than 2 years old. Special order from Whelen, only does air horn & PA. Can be sent back to Whelen for all tones to be enabled for about
$45. Asking $100 or best offer.

- Motorola Spectra programming cables $45 plus shipping, for low & mid/high power models.

- Motorola Maxtrac / MCS 2000 programming cables $40 plus shipping.

Please E-mail inquiries to JCMEDIC2@AOL.COM

7678. Beware of Dick Burke

Newsgroup: rec.radio.cb
Date: 2000-06-27 00:00:00 UTC
From: richcom@earthlink.net
Message-ID: <395b3618.13123510@news.earthlink.net>
Source record: 41451

He goes under two emails: n1rsp@qsl.net & toby@gis.net

I replied to a post regarding two laptops. Dick told me they had two batteries and no power cords. He told me they did not have built in mouses but would supply a mouse for one. I said fine for $85. He would only accept Cashier's Check. Everything was his way.

After my cc was in the mail, he emails me the next day, Sunday, telling me, oops, sorry only one battery. But I'm throwing in the mouse. Well, the mouse was already in the original deal. So now for my money I'm only getting one battery where I was purchasing TWO.

Now it's not a deal anymore. So I quickly emailed him back and told him that I did not want the deal anymore and to please send back my cashiers check when it arrived.

To verify it, I phoned him on Monday, because NOW he's ignoring my emails. His wife rudely spoke to me and acted stupid. She didn't know where he was or when she would see him. That was the second hint that I was dealing with unscrupulous people.

What a pair! They deserve each other.

So I phoned again that evening and the phone was busy and still no emails.

The next day, he decides to tell me that my check was immediately deposited and my computers were in the mail. WOW, isn't that something, he takes my money and sends me what he wants, which is a lesser deal than agreed upon.

His emails became very foul and abusive. So I am now dealing with a trashy mouthed person. I'm out the $85 but I hope this is a warning to others before dealing with such garbage.

If anyone wants to see his nasty emails. Let me know, I'll send them to you.

I was a gentleman through the whole deal. Something that he can't say

about himself.

So BEWARE of trashy, crooked, lying DICK BURKE.

The moral of the story is: he misrepresented his items, took the money and ran!

He decided to change the deal and I am stuck with it. Is that fair to

anyone out there? You decide.

7679. Re: Palomar 300a info and Bill's still full'o crap

Newsgroup: rec.radio.cb

Bill! I wondered when you'd return back after our last debate. As usual, you spout out more crap showing you don't know anything serious about amplifiers. Anyone reading this post may research our last debate where Bill tried to teach amplifier modification class 101 with some pretty big mistakes thrown in. I pointed out his serious errors and he went poof! Deja news would be a great way for readers to search out past Bill diatribes.
So now your back for more... Let's see what's up below:

: Bill Eitner <kd6tas@freewwweb.com> wrote:
: That's alot of bullshit that won't get you better results than
: just tuning into the antenna for maximum MODULATED output using
: the meter on the front of the amp.

Well, your wrong... simple enough. One of the reasons I offered to Email the original factory directions is that it does matter. Coupling of an Amplifiers Loading cap can and often does change it's linearity. So far a few people have Emailed me for the information. The theory behind it is way past your level Bill.

: That's why the meter is there
: and why it says "tune for max." The original tune-up instructions
: say that tuning for maximum peak (modulated) output power is an
: alternative to their wordy technique that has you tune for maximum
: carrier and then over couple the plate load cap to compensate.

Compensate for what Bill..? My instructions posted before are a little better than the factory's paperwork. Everyone really should tune any amplifier into a termination (dummy load) first.

: In the end, the instinctual response is to tune for maximum on
: the amp's front panel meter anyway. You might as well learn how
: to do that properly right from the get-go.

Instinctual if your a hack amp person like you seem to be offering up all the time. The meter circuit in the 300a is a simple quanity diode detector type that doesn't care if it's looking at forward or reflected power. That's the reason you would hopefully use a termination to initially tune the amplifier. A proper watt meter measuring forward and reflected power is the way to go. I like the Autek WM-1 myself, it's automatic and uses a bruene detector circuit with rms and peak responce times.

Learning amplifier electronics right seems to be something you avoid Bill, why don't you pick up an ARRL Handbook off Ebay and start off with some better information. Quit putting your wrong opinions out for others to

read as hack theory.

cheers

7681. Re: need schematic for 12 volt 20 amp supply

Newsgroup: rec.radio.cb
Date: 2000-06-27 00:00:00 UTC
From: Skipp <skipp@pilot.ucdavis.edu>
Message-ID: <8jbcoiffv2@mark.ucdavis.edu>
Source record: 41454

: Hamm4fun <hamm4fun@aol.com> wrote:
: I hate building them from the ground up.

why..?

: I like to start out with a good
: regulated 5 amp power supply with remote sensing. Then paralell about
: 4 of your favorite power transistors together. Feed the base of the
: transistors with the ouput of the power supply. Connect the sense
: line to the emitters which will be the final output. The collectors
: should be fed with a diode /cap arrangement that will give you at
: least 18 volts before regulating it. Since you are more than likely
: going to be running it at about 14 volts I would want the voltage
: to be about 20 before regulating it.

Wow, talk about a kluge design and a waste of time.... plus some pretty
poor regulation. Oh yes, and a lot of heat.

Building one is another project that should be properly researched. The
ARRL Handbook has some good information and projects along those lines.
Look for them cheap on Ebay. Ask Astron for a circuit diagram for the 20
Amp power supply.

cheers

Frank,
Don't try to figure it out, or wasting your time trying to
convince people they don't "need" all that power. I think it
has something to do with testosterone levels, and relating POWER
with what's 'hanging'.
'Doc
PS - Can you imagine the psychological affect of 'popping' a
tube or transistor?? LOL

Extensive grounding helped on one of mine, I never had any problems except when using a powermike and external amp. You might also reply hear with a brief description of your installation, IE: is it mobile? base? is it a problem that all the sudden started? new radio, new install? Have you tried on another antenna system? Answers will help diagnose the problem.....

You can't beat tubes for fidelity and audio quality! thats just like Amps, If you have a pair of "fresh" 3-500z's in a decent amplifier They add noticableably to the transmitted audio signal, after a few hundred hours the z's will still be full output but will lack this extra fidelity and punch..... Its a known occurence, most folks in the know will sell the z's off to CW operators after they lose the edge..... The Trams always have been a great radio! glad you found what you were looking for!

Depends on which Yaesu..... some are simple keyboard entry to mod,
others are tear the face apart, cut/remove, jumper a component, reset CPU
and go to town.....

either way its not too difficult!

HEY! Hasn't anyone ever told you that there are at least 38 other channels...if you do not like channel 6 or 11, or feel intimidated when you try to say "hi guys", then you may consider using that large knob on the far end of your radio marked "Channel" (or push-buttons on your Cobra 19) and try another channel, I suggest channel 19 and hook up with a big truck driver named Bubba who has the same feelings on different races..who knows, you two may bond...hehehe

What do I need to do to get heat off my mic and radio when
I,ve got my amp on? (other than get rid of the amp)I have
everything grounded and have a good swr reading 1.3swr.
I'm running a xforce 1x4 with a low dead key and when I key
up I can feel the heat on the radio and I don"t dare put my
lips to the mic. Any help would be great.
Thanks

Doc;
I did, there is nothing wrong with numbers I posted, other than
using your "variable names"

Z = sqr_root (Z1 * ZO)

Where Z is the impedance of the 1/4 wave line
Z1 is the antenna impedance
ZO is the impedance of the line to which it is to be matched
(ZO is what you want to tranform the antenna impedance to.)

In Hamm4funs post,
Z1 = 25
ZO = 100

Solve for Z we get 50 ohm coax

In your formula you quoted, you are using a 35.35 ohm line to
transform a 25 ohm antenna to 50 ohms. 2 50 ohm antennas fed in the
way we are discussing would result in a 25 ohm impedance to the radio

Go to http://members.home.net/ac3l/qtrwavtr.htm

Plug your numbers in and see what the results are.

Your are still looking at the formula wrong

By the number of times you said to search for it, you could have told us the answer :). I'm sorry if it's been answered before, but I absolutely can't find anything about it in the searches. ....so what is it?!!

Sorry this is off topic, but alot of you know quite a bit about antennas :).

Anyhow, we're running new TV wiring though the house, but we can't get cable TV (too far away from town), so we have to go with an antenna (or two or three). I've heard antennas are 300ohm, but my brand new 800' roll of RG-59 cable is 75ohm. Is this a problem? I think I've done it before without any problem....I was just planning on running the wire to each TV from the antenna, then hooking it to the F connector. Is that alright? Do I need one of those 300 to 75ohm converters?

Also - I have 3 great big TV antennas I want to mount in the attic. Can I just take the cable from each of them and "Y" it all together? Then run that one cable to the TVs?

Try one outdoor antenna with a signal booster. Run the coax to a
multiple splitter. Feed all your TV's from there.

>I've heard antennas are 300ohm, but my brand new 800'
>roll of RG-59 cable is 75ohm. Is this a problem? I think I've done it
>before without any problem...

The 75 ohm is preferred. The antenna is 300 ohms so use a OUTDOOR
300 to 75 ohm transformer.

>.I was just planning on running the wire to

>run that one cable to the TVs?

To many possible ghost problems with multiple indoor antennas.. Use
one large outdoor antenna with a booster.

Well lets give this some thought, you can talk to people via chat room all over the world, a CB you can not. So what's wrong with having a chat room so people around the world can chat, listen ,learn? Don't you think you're being a little narrow minded? Personally I think it would be a good idea. Why don't we all give it a try? MS also has something new out called voice chat where you can actually talk and hear people.Might work out better then all the posts out here. Just my two cents, if you don't like it keep the change...LOL.

If you find one it will be a tube type with a vibrator power supply. I'm pretty sure none of the solidstate radios were 6volts. There are companies that make DC to DC converters. Try Packaged Power or Computer Products. One is a divsion of the other, not sure which is which.

> ohms, meaning you would see an SWR of 2 to 1 at resonance. This is the perfect
> case for using a 50 ohm harness instead of a 75 ohm one.

Not exactly.
Perfect case, no reactances.
1/4 wave length separation.
--------Case #1--------
phasing lines = 50 ohms[E1/4 wave length each]
Ant.#1 = 25 ohms Ant.#2 = 25 ohms
Zo = SQR(Z1xZ2) Zo = SQR(Z1xZ2)
= SQR(25x50) = SQR(25x50)
= 35.35 ohms = 35.35 ohms
Zo = (Z1+Z2)/2
= (35.35+35.35)/2
= 35.35 ohms [junction of two phasing lines]

Zo = SQR(Z1xZ2) [50 ohm feed line]
= SQR(35.35x50)
= 42.04 ohms impedance at radio end of the feed line.

------Case #2-----------
Same as above except phasing lines of 75 ohm impedance

Zo = 43.3 ohms Zo = 43.3 ohms
Zo = (43.3+43.3)/2
= 43.3 ohms

Z0 = SQR(43.3x50)
= 46.5 ohms impedance at radio end of feed line

Not a lot of difference, huh? With out all the formulas, using
93 ohm coax would give 49.1 ohms impedance at the radio, and
using 120 ohm coax would give you 52.3 ohms at the radio. Wish
'they' made 120 ohm coax...
'Doc

7722. Re: President Radios

Newsgroup: rec.radio.cb
Date: 2000-06-27 00:00:00 UTC
From: gadget <gadget@jnlk.com>
Message-ID: <8j9i05$mq5$1@nnrp1.deja.com>
Source record: 41505

There has always been the use of illegal radio equipment on the CB band. It's just so simple to modify most HF rigs to do it. Some, even from the factory will transmit on 11 meters. Years ago, people ran Yeasu FT101's and Siltronix 1011's, along with who knows how many other brands of ham HF rigs on the CB band. Nowadays, with the huge influx of "export" rigs (Galaxy, Superstar, etc.) it's just that much cheaper to have a radio that will out-perform the average "legal" CB.

Almost all the export radios are so obviously designed for CB use, it's a wonder they were ever allowed into this country anyway. Why on earth would a 10m operator want a radio with 40 channel bands, that even provide for the "A" channel gaps, echo, a voice disguiser, and no split frequency operation? The only commonly avaliable radios that really would make a legitamate HF rig are the RCI 2950, 2970, and the President HR-2510 and all it's clones. The 2510 has no split, but the 2600 does. It is, however, lost when modified for use on the CB band.

We were discussing CBs and he said when he lived in LA, certain ethnic groups talked on these groups. I guess I should have called him a racists when he said hispanics speak spanish on Chan. X. I mean that statement was just un called for. He must have been a hispanic hater to make an assumption that those speaking spanish were not all black.

> Chances are your buddy as well as the Ethnic group on the CB are Racist to
> one extent or
> another...

Yea, whatever twit.

> You realize when YOU make a statement like"I have nothing against Blacks,
> I have a Friend who is Black!" it is a racial statement...

Ok, what in the above statements had this in there? NONE. My friend said the hispanics speak spanish on a certain band. That's it. But under your assumption he is a racists for thinking that these are just hispanics and not Russians speaking spanish.

> The politics Of racism can make your head spin! I know, I

>
> LOL, there you go, are you insinuating ALL HAMS are WHITE?

Do you like mis quoting people? I specifically said "All ham I (THAT MEANS ME!!) know are white." I did not say "All hams are white." I know there are people of different races who are hams. Just because I don't know any and state that, you take my words and say I am trying t say there are no black, hispanic, Indian hams.

> If you were to encounter a Black Ham would he get as polite, and warm
> welcome as a
> "WHITE" ham?

It's not a color issue. It's a human issue. You are assuming that all white hams act polite and welcome. Well I have not met every single white ham and I doubt your logic is flawed since I don't think you have met them all either. Every new person I meet, ham or not, is different, not in terms of color, in terms of human interaction. I know humans can be mean and nice. I just wait and see how they treat me before I pass judgment.

> Since all Hams you know are white you can only answer with an
> opinion, rather than a fact!

This statement is so stupid I don't know what to say to it. This statement applies to every fucking situation in the world where you have yet to meet ANY human being. Doesn't matter if they are a ham, black, truck driver, etc.

> Chances are this guy may not know a black ham
> > user.
>
> Yes this could indeed be FACT! I've found that ALL of the Black HAMS I
> know are quite practiced and proficient with speaking in a way that completely
> hides there heritage!

It's not about heritage. It's about culture. The younger black generation (and white and ever other kid of the 80s/90s and today) are growing up with slang from the hip-hop/gangster rap/gothic/urban/rave cultures. Same applies to those who grow up in different areas of the country. Like I said before, most people hang with those of similarity. It's what has caused a lot of race problems, but it happens oh well. Therefore, most of the hip-hop slang I hear on 6 I am going to assume from logic is coming from a black male. Pure and simple. Nothing racists here.

> >However, it's easy to see that blacks use CBs as do whites,

> certainly ARE a racist!

Fuck you. Twit. I am white. I am DIFFERENT from a person who is black. It's not the same. Maybe you should look up different and same in the dictionary. I used they because this whole thread is about white/black issue. If I start grouping everyone together my message would make no sense. Get off your high horse, hell your the one married to the Nazi or whatever they are.

> Or that the majority of truckers are black CBer's???? please elaborate??

There are black truckers. I never said there are a majority, but that there are a good number. I see black truckers and it's not like it's a once in a life time thing. That's my point.

>
> > Right, but even I have wondered why these people talk the way they do.

She gets on the same high horse as you with this 'sounds black'. Blacks started the hip-hop culture. I would easily admit that. Most people who say white people talk black really need to say white people talk hip hop, meaning they are trying to be like those in the hip hop culture. PS; I do not hold Brittany Spears and those like her in the hip hop culture. It was started by mostly, if not fully, blacks.

Message-ID: <8j9neq$1hs$1@plutonium.btinternet.com>
Source record: 41512

Hi, thanks for the replies so far, I'm working on getting it going. I have just found another antenna from and old van my dad had, it's about 4 inches shorter and made of fibre glass. Same spring setup at bottom but only a single connection at base of antenna - that is to say there's no ground connection. I took it out yesterday to use over a motorway bridge, I could here people (obviously with big base stations) from up to 10 miles away load and clear - like a normal radio station, but even when I drove to the town they said they were talking from I couldn't get them to hear me. Anyway, that antenna wasn't from this radio, maybe I'll try the original one today.

To help with the confusion, a small pic of the radio is posted here (www.btinternet.com/~j.buckle/image1.jpg)
and a pic of the antenna is posted as
www.btinternet.com/~j.buckle/image2.jpg

Please keep sending the help, I'm starting to learn! Just bear with my stupidity!

Thanks again
James.

I believe that this "export rigs are illegal" stuff hasn't yet gotten to the MFGRS. A quick call to Galaxy, RCI etc.. will verify that they are still legally importing, marketing & selling their radios. It seems that the FCC has over the last year or so "bothered" an individual truck stop & a few people at hamfests selling new Galaxies & 2950's, but they haven't touched a single distributor, Ranger or Galaxy in regard to the matter. I guess they figure the "small guy" can't fight back much. Also, I heard about that original "fight" between the FCC & Customs over a shipment of Mirage 2950's & I believe (not 100%) in the end that Customs "won", & the radios were allowed in due to current regs. If the FCC really want to stop export radios, all they would have to do is amend their regs to say something like, " All Amateur radios designed to operate between 24 & 30Mhz shall not have a 40 ch dial selector, or any banks or combinations of 40ch memories", and "there shall be no unactive Band selector swithches." This would still allow a 2510/2950/Mg257 to get in while making it harder for the CB style export rigs they seem to worry about.

> Zo = (Z1+Z2)/2
> = (35.35+35.35)/2
> = 35.35 ohms [junction of two phasing lines]

Your using the formulas incorrectly.

Z1 = Antenna impedance
Z2 = desired impedance
ZO = coax impedance

coax imp = sqr_root (antenna * desired impedance)

so for a 25 ohm antenna and 100 ohm desired ouput

coax imp = sqr_root (25 * 100)

solve for coax imp, = 50

so a 1/4 wave of 50 coax will transorm the antenna impedance to 100
ohms.

output impedance of the 2 antennas = 50
(since 2 100 ohm resistors in parallel = 50)

>
> Zo = SQR(Z1xZ2) [50 ohm feed line]

>'they' made 120 ohm coax...
> 'Doc

Using 75 ohm coax and a 25 ohm antenna, you would have 112 ohms seen at the radio. 93 ohm coax would yield 172 ohms and 120 ohm coax would give you 288 ohms at the radio.

7746. A STORY FOR NEWBIES.....READ*******

Newsgroup: rec.radio.cb
Date: 2000-06-27 00:00:00 UTC
From: jj475171@aol.com
Message-ID: <20000627143811.04378.00000017@ng-ff1.aol.com>
Source record: 41529

About 26 years ago I got the fatal bite of the c.b. radio hobby. I wound up at the local Radio Shack, popped down $350.00 on a TRC-456, with a Realistic Desk mic. I loved that radio, (still do) I'd stay up all night ratchet jawing with anybody that would listen. Every so often though I would end up hearing a guy out there that time after time ALWAYS sounded like GOD ! (he sounded like a $5.000.00 stereo) I'd say to myself.....man, what the hell is this guy using for a radio? I did'nt call for this guy, because he never talked to anyone other than his family, when they were mobile. He never sounded raspy, fuzzy, or garbled. A few day's later I finally got up enough nerve to call him out, I said to him, sir, may I ask you a question about the radio your on?.....He came back to me ! Said sure you can, Im running a Tram D201 he said, (do you approve?) he said. The only thing I could utter was...sir, YOU SOUND LIKE GOD. We laughed it off, continued talking for a few minutes, and then ended the Q-so. For about 26 years I tried to duplicate that sound, I bought linears, radios, mics, and speech processors, but I never did replicate.....THAT SOUND !!! New Trams were selling for between $950.00-$1,000.00, so that was out of the question. Used Trams were either hard to find, or just too beat up to spend the money on. WELL, about a year ago I finally found one to my liking...(and within my budget) it was the 40 ch Tram D201A.....a few months later.....another one,.....a D201, just like the one that guy had !!!!!!! (was I happy?) YEA ! you could say so !!! After spending litterally thousands & thousands of dollars on one transistor after another transistor (type) of C.B. radio, Ive finally found that "HI-FI" quality of sound. This post was NOT intended as a Bragging session.....I guess my intent was to inform the "newbies" out here that they can accomplish a lot more by spending their money on a GOOD, UN-ABUSED, tube set type C.B. Dont waste your money (like I did) on all of this un-nessecesary junk like....linears, some export radios, and transistor sets. Your money would be much better served by investing it into an ol' Tram or Browning Golden Eagle. And I guarantee.....no-one will sound half as good as you do, in your town/city. Take it for whatever its worth, but I dont think any-one could give an intelligent argument on "why you should'nt" buy one of these radios.....Best Regards, 73, Frank.

JJ,

There is a good friend of mine in Lincolnton, NC at Scientific Electron-
ics (he's semi-retired) that has some Tram D201s. If you will call
Jim at 704-748-9644 he may be able to help you. He will NOT screw you
over. Known him for 35 years. IF you could see his shop and the
"stuff" he has, you'd know he's a radio man's radio man! LOL!

Hope this helps.

73

Jerry

Actually on my old FT-101E all you have to do was remove a ground to be able to xmit on the 11 mtr band. The FT-101 series were sold with the ability to receive 11 mtrs before any mods were made to them.

Source record: 41489

The problem is a form of front end overload! Nieghbors to close to antenna systemand the combo of too much wattage! Height of the antenna can help plus change to a diff antenna! Like a 5/8th groundplane or beam! That alot of wattage! If the guy was cool he could always go over and see first hand what the effected components are and try cores on them of the right mix (73) shielded wires power filters all help! But 1500watts 40' away from someone 20 aint gonna help much! He also needs to make sure everything is well grounded!

>and you'll see the price it got on Ebay. ($60.00)
>

Howdy Scott-
I agree it's a bit high if the unit's not in the best condition, but eBay is not a good indicator of market value... a thing is worth what somebody's willing to pay for it, and as I'm sure you know, there are all kinds of things that sell on eBay for much more money than any reasonable market "book" value would warrant.
The reverse is true as well, as I've seen steals on eBay compared to what the current trends would indicate.
Just a minor point, please ignore if you wish! :-)

The guys on channel 6 are mostly blacks.

That is the truth. Does that make me a racist?

7785. Re: Palomar 300a info and 'ol Skippy is boiling mad (again).

Newsgroup: rec.radio.cb
Date: 2000-06-28 00:00:00 UTC
From: Bill Eitner <kd6tas@freewwweb.com>
Message-ID: <395A2411.628E4E4E@freewwweb.com>
Source record: 41558

I've upset you again haven't I?

Go ahead and prattle on about what you think is the right way
to tune a tube amp. Sooner or later you'll come around.

It boils down to two methods:

Tune for maximum peak output and leave it at that.

Tune for maximum carrier output and then overcouple the plate.

The former is unquestionably the best for SSB. So, all
that leaves is the question of the best AM method. I,
and probably most other tube amp operators/techs, prefer the
former. Both methods arrive at nearly the same result
anyway. The difference is that the former is more precise.
Turning the plate knob some preset amount to overcouple is
basically an educated guess. Furthermore, tuning for maximum
peak power often results in a slightly different tuning of
the driver and antenna tune controls. With a 300A that
seemingly slight difference can amount to an increase in output
of 100 or more peak watts and a beneficial reduction in plate
dissipation and power supply load.

It's the year 2000--not 1976. Sweep tubes are expensive
and OEM power transformers for sweep tube amps are nearly
impossible to find. Tuning for maximum peak power results
in minimum plate dissipation, less stress on the power supply,
maximum audio punch, and perfectly acceptable linearity.
Those are year 2000 priorities. Sticking to factory instructions
is just more crap that guys like you spew unrelentingly. And
adding your own little twists and recommendations to it makes you
just as much a "hack" as you accuse me of being. Think about it.

And on the matter of our last "debate;" in the
last 4 years I've probably logged more than 1000 hours beating
down misguided, impractical, theoretical arguments out of guys
like you. I've come to the conclusion that there will always be
another wannabe orthodox engineering type showing up on this CB
newsgroup to tell me/us that everything I/we know is wrong and
to show me/us the "right" way to do things. If responding
until I don't anymore and calling it a victory makes you
feel better--be my guest. I've done my time here. My
credibility is established. I don't intend to debate these
petty issues to the death anymore. People can believe who
they want or try both methods and decide for themselves.

Hey, that was definetly uncalled for. I had absolutely no intention of being rude, incosiderate, or stupid. I was not trying to be sarcastic, I seriously didn't understand the purpose of the chatroom idea! Allow me to elaborate : Here, a newsgroup, is not much of a "social" forum, but more of a Q&A-type deal. A chatroom would be more of a social forum, because of it's nature. It would be awfull hard to use a chatroom to answer questions, because the "experts" couldn't always be on, etc. Now, seeing that the purpose of CBs is often of a social nature, it doesn't make sense (to me) to use a chatroom. It's like emailing someone, then calling them and saying "Did you get my message?!!". Anyhow, that's just what I think......

No. They labeled it because it is a splitter and not a simple Y
adapter. A splitter needs the connections labeled because of
the voltage splitting circuitry within it. All connections are not the
same and therefore should be labeled.

The term "Y connector" that you used in your description
is the incorrect terminology. This IS the case because a simple
Y connector is never labeled IN and OUT as you said.. With Y
adapters all connections are the same.

If you are using this device for the purpose of running two TV's
from one antenna cable then you need a splitter.

7795. Re: Rf Heat on mic

Newsgroup: rec.radio.cb
Date: 2000-06-28 00:00:00 UTC
From: Bill Eitner <kd6tas@freewwweb.com>
Message-ID: <395A2FEC.54627FA7@freewwweb.com>
Source record: 41568

Sounds like an antenna problem. Were the SWR readings you posted taken between the amp and antenna or radio and amp? There's a big difference. With the symptom you describe it sounds like the antenna could be breaking down when the amp is on, or the antenna (RF as opposed to DC) ground is bad or insufficient. Either of those problems will show up as a drastic increase in the SWR reading between the amp and antenna when you turn the amp on. Amplifier instability is another possibility; however, with an X-Force amp any in-stability is likely to be caused by the weird load (antenna problem) that the amp has to work into.

My suggestion is to re-check the SWR between the amp and antenna with the amp off and again with it on and note the difference. It'll very likely be quite a bit higher with the amp on. If so, go over the antenna system and look for a resistive ground connection at the mount and/or a damaged load (coil assembly). I'm assuming you're not using a mag-mount or a 102" whip. X-Force amps (as well as most others) don't like mag-mounts, and they work best when using resonated coax lengths.

Resonated coax lengths are as follows:

12 feet for regular (solid dielectric) RG58, RG8, RG213, and RG214.
13 feet, 7 inches for foam dielectric RG8X and RG8M.
14 feet, 6 inches for foam dielectric RG58 and RG8.
15 feet, 3 inches for 9913 and LMR400.

Those lengths or multiples thereof are what most CB amp builders use when designing and optimizing their units. Duplicating what was used when the amp was optimized is always a good idea.

Make sure the antenna has an adequate ground plane to work against too. In other words, the coax shield has to be solidly connected to a large piece of sheet metal right at the mount. Ladder racks, small tool boxes, and especially non-metallic objects like fiberglass camper shells won't provide an adequate ground plane (image antenna) and will look like an open or resistive RF ground to the amp.

When you run an amp the details of the rest of your system come into play. In other words, stock radios and low power systems are alot more forgiving of short comings in the

rest of the system. Alot of people end up finding out about
that the hard way.

I hope this helps. Good luck.

I have already done the channel mods and since I use this mobile and base with a constant 12volts I would like to up the power slightly. 5 watts out on SSB is kinda low, I think. Is their a way to turn up both AM and SSB power little bit? Not to much but just so I have it at a good level. Thanks~!

Source record: 41575

I don't think there's really any difference. In a multi-amp
set-up, YOU decide what the peak to carrier ratio will be.
In other words, you decide whether your system is a "maul"
(big dead-key in relation to the peak output) or a "swing"
(low dead-key in relation to the peak output) system based
on how you adjust the radio and/or the driver amp(s).

If the subject of race is brought up pertaining to a certain channel or frequency, I would have to ascertain that, yes, there is a bit of a racism in that comment, no matter how you try to approach it. After all, radio is color blind, so what the hell does it matter who is what? Who is to say that 6 is mostly anything besides lotsa big radios? Because of what you interpret by what you hear you automatically assign a color to the voice in your radio? Man, you got too much time on your hands!

A guy went up to the counter in the library and said, "Have you
got any books about committing suicide?"

The librarian said, "Yes. Take a look over there, somewhere on the
middle shelf."

The guy came back a few moments later and said, "I can't find any
at all."

The librarian replied, "Yes, it's awful. The bastards never bring
'em back!"

SIGNS:

Plumber:
"We repair what your husband fixed."

On the trucks of a local plumbing company in NE Pennsylvania:
"Don't sleep with a drip call your plumber."

Pizza shop slogan:
"7 days without pizza makes one weak."

At a tire shop in Milwaukee:
"Invite us to your next blowout."

Door of a plastic surgeons office:
"Hello, can we pick your nose?"

Sign at the psychic's Hotline:
"Don't call us, we'll call you."

At A Laundry Shop:
"How about we refund your money, send you a new one at no
charge,close the store and have the manager shot. Would that be
satisfactory?"

At a Towing Company:
"We don't charge an arm and a leg. We want tows."

Billboard on the side of the road:
"Keep your eyes on the road and stop reading these signs."

On an Electricians truck:
"Let us remove your shorts."

In a Nonsmoking Area:
"If we see smoke we will assume you are on fire and take
appropriate action."

On Maternity Room Door:
"Push, Push, Push."

At an Optometrist's Office
"If you don't see what your looking for you've come to the right
place."

On a Taxidermist's window:
"We really know our stuff."

In a Podiatrist's office:
"Time wounds all heels.

On a Butcher's window:
"Let me meat your needs."

On a fence:
"Salesman welcome, dog food is expensive."

At a car Dealership:
"The best way to get back on your feet -- miss a car payment."

Outside a Muffler Shop:
"No appointment necessary, we hear you coming.

Outside a Hotel:
"Help! We need inn-experienced people."

On a desk in a reception room:
"We shoot every 3rd salesman, and the 2nd one just left."

In a Veterinarian's waiting room:
"Be back in 5 minutes, Sit! Stay! "

At the Electric Company:
"We would be de-lighted if you pay your bill. However, if you
don't, you will be de-lighted."

On the door of a Computer Store:
"Out for a quick byte."

In a Restaurant window:
"Don't stand there and be hungry, come on in and get fed up."

Inside a Bowling Alley:
"Please be quiet, we need to hear a pin drop."

In the front yard of a funeral home:
"Drive carefully, we'll wait."

In a Counselor's office:
"Growing old is mandatory, growing wise is optional"

wilson 5000 is what i have and i am thiking of switching to a president penn.

the president penn claims to be a 7/8 wave tpye antenna . with a 6Db gain

what i do know is that is has 2 feet more actual antenna .

the wilson may have longer electrical length due to the coil . but the
president has longer mechanical length .

whats the opinions out there on these two ?

>anything
>about it in the searches. ....so what is it?!!

Channel 6 is for the big cb stations and mostly competition skip is on that
freq. You do not go to channel 6 for a conversation, but you can go there for a
tune up to see if your station is strong enough. If you want to chat or if you
cant handle channel 6 there are at least 39 more channels to chat on!
I hope that helped!

There may, or may not be a good DC ground. One thing that is certain is that
there is not a good rf ground at the transmitter. Those currents on the
outside of the coax are causing the problem - and need to be eliminated.

That can be done with chokes or coaxial "line isolators".

Hacksaw,
It sounds like your radio is 'ate up' with RF. No matter
what your SWR is, I'd start taking a good look at the antenna,
and the amplifier. If the mic is that 'hot', power isn't
going where it's supposed to be going. I'd make real sure I
had a ground on the amplifier too. The coax shield is NOT a
ground, so if you don't have a ground, you need one. I'd bet
that if you turn off the amplifier, the 'hot' mic goes away.

Leave it alone. All late model Kenwood radios use low level
AM. If you start changing (diddle-sticking) a Kenwood, all that
you'll do is screw it up.

Ok, one more question: On those Y adapters for coax cable, is there any difference between a "In" port and an "Out" port (would it matter how I connect the cable to that - I mean, do I have to have the "in" wire going to the "in" port? I thought they just connected the whole works together inside....)

i was wondering the same myself since they did not incurr the cost of
research and development . they are selling everything much higher than what
you can buy from the original maker ... look at the prices of the regulators
and the mounts they copied off dave. you will pay 2x the price with xforce
as compared to the original maker .

I agree completely. This thread is horrible. I was glad to finally read that someone else thinks that also. But, you know it won't stop. That is why I generally talk sideband now. I can only handle so much of the trash on regular CB channels. And I know that I can't talk on channel 6 with my mudduck base, but at least the guys on channel 6 don't call each other names and all that crap.

There's more to it than just interconnected wires. Use the IN port
as the IN port.

7875. Re: Palomar 300a info and 'ol Skippy is boiling mad (again).

Newsgroup: rec.radio.cb
Date: 2000-06-28 00:00:00 UTC
From: Skipp knows Bill is a fool <skipp@pilot.ucdavis.edu>
Message-ID: <8jdp49$l8j$4@mark.ucdavis.edu>
Source record: 41648

: Bill Eitner <kd6tas@freewwweb.com> wrote:
: I've upset you again haven't I?

No, you dissapoint me by signing your ham callsign, while spouting garbage as technical information.

: Go ahead and prattle on about what you think is the right way
: to tune a tube amp. Sooner or later you'll come around.

To what Bill..? your wrong way..?

: It boils down to two methods:

: Tune for maximum peak output and leave it at that.

you are wrong and a fool Bill, "two mints in one"

: Tune for maximum carrier output and then overcouple the plate.

How does one overcouple the plate Bill..? And by how much..? All amplifiers Bill..?

: The former is unquestionably the best for SSB. So, all
: that leaves is the question of the best AM method. I,
: and probably most other tube amp operators/techs, prefer the
: former. Both methods arrive at nearly the same result

You are not a tech, your a hack Bill... and a bad one at that.

: anyway. The difference is that the former is more precise.
: Turning the plate knob some preset amount to overcouple is
: basically an educated guess.

Not when I can see the difference on my spectrum analyzer. One can measure the difference with test equipment described in the ARRL Handbook I suggested you buy.

: Furthermore, tuning for maximum
: peak power often results in a slightly different tuning of
: the driver and antenna tune controls. With a 300A that
: seemingly slight difference can amount to an increase in output
: of 100 or more peak watts and a beneficial reduction in plate
: dissipation and power supply load.

You are wrong Bill, take a moment and explain the theory of the above to use to prove yourself out.

: It's the year 2000--not 1976. Sweep tubes are expensive
: and OEM power transformers for sweep tube amps are nearly

: impossible to find. Tuning for maximum peak power results
: in minimum plate dissipation, less stress on the power supply,

You are wrong again, what about plate current dip which is almost never the same as max power, peak or otherwise. While your at it, tell us your definition of peak power.

: maximum audio punch, and perfectly acceptable linearity.
: Those are year 2000 priorities. Sticking to factory instructions
: is just more crap that guys like you spew unrelentingly. And
: adding your own little twists and recommendations to it makes you
: just as much a "hack" as you accuse me of being. Think about it.

I do Bill, that's why people need to know how wrong you really are. The factory built the amplifier, not you. Any day you want to go head to head with me over electronic theory, experience or education... you just say it. I'm just glad your hack posts haven't gotten anyone killed yet.

If you lived anywhere close to me and ran any amplifier wrong, I'd hear the difference... give you one chance to fix it right with the proper answers to any questions you had... Then I'd be all over you the next time I heard it across the band.

: And on the matter of our last "debate;" in the
: last 4 years I've probably logged more than 1000 hours beating
: down misguided, impractical, theoretical arguments out of guys
: like you.

You seem to leave off what our last debate was Bill..? Your wrong method to hack up the output section of a tube amplifier! I pointed out your serious mistakes then, just as I do now. Anyone with a web browser can find it in the deja news archive. 99.5 percent of your theory has errors and omissions. Some day someone's going to get hurt if they listen to you. I hope they wont...

: I've come to the conclusion that there will always be
: another wannabe orthodox engineering type showing up on this CB
: newsgroup to tell me/us that everything I/we know is wrong and
: to show me/us the "right" way to do things.

I'm just talking about your regular bad information here Bill. Don't try to hide it with an "me/us" or "I/we" smoke screen. You also try to go off topic quite a bit. I've been around here a lot longer than you... your not the first hack around, nor will you be the last. But you post a lot of crap information that's wrong.

: If responding
: until I don't anymore and calling it a victory makes you
: feel better--be my guest. I've done my time here. My
: credibility is established. I don't intend to debate these
: petty issues to the death anymore. People can believe who
: they want or try both methods and decide for themselves.

Credibility with who Bill...? You can post to your hearts content on any news group. If it's wrong I'll be real quick to tell you and everyone else about it.

I provided the facts, information, references and the source material about the palomar 300a operation.

You provide nothing but bad hack crap diatribe without any of the above mentioned, it will degrade the preformance of the equipment. I hope everyone on this news group reads this to learn that you really are a fool.

skipp

No it doesn't. Look - it's a SCIENTIFICLY PROVEN FACT that white people are more intelligent then black people, they make more money then black people, and aren't as "prone" to criminal activity as black people. So......by saying those things, does that make me racist? Would it be better if we all just forgot about that? Said it wasn't correct or something?

For all you know, I could be black. Maybe you ought to think about that before you say anything else..... I know in our "politically correct" society race, sex, and age aren't supposed to matter - but the truth is we all form prejudices without even thinking about it. For example - if you walked past a black person on the street in a big city, would you feel more frightened then if you walked past a white person? Of course you would.

Your post is just begging to be torn apart, but by the last few remarks you made, it is quite clear you are an imbecile. First off, going by YOUR own logic, one can draw inference that the less educated (read ignorant) is prone to crime. The word is spelled "s-c-i-e-n-t-i-f-i-c-a-l-l-y". I could have overlooked the spelling (as I usually do) but yours was not a slip of the key. It was ignorance. When do you get off parole?
Secondly, I would not be frightened walking past ANY one in a big city. Were you beat up by someone for spewing that venemous trash in a big city? I'm a child of the 60's and some of us have learned over the years that predjudice and hatred is not inbred to mankind, rather, it is a learned and voluntary trait. However you choose to think reflects upon your actions and words. But do not come here and try to pass it off as a predisposition of character.

>if you walked past a white person? Of course you would.

I would? Interestingly enough, I am from Philadelphia, PA. Now with that said, I might add that the area that I actually resided was a suburb. Within this suburb 70% of the population was made up of all types of ethnic groups besides that of the white ethnic. I guess I was a frightened motherfu*ker then huh?

Funny how I dont remember being scared. How is it that you are scared when you walk by someone that is not white? Are you affraid that their skin color is going to jump right off of theirs onto yours? Are you affraid that they will mutate into some outter space alien?

Food for thought:

When the white man stays out in the sun too long they turn red.
When the white man suffers from hypothermia they turn blue.
When the white man burns from fire they turn black.

So who was it again that is colored?

Oh. I -am- white. Just in case anyone really cares. I dont. Actually Im
brown at the moment, I have a decent tan going.

7914. Re: Rf Heat on mic

Newsgroup: rec.radio.cb
Date: 2000-06-28 00:00:00 UTC
From: Hacksaw <BRomeroNOBRSPAM@worldspy.net.invalid>
Message-ID: <0e4bc54d.102abd3d@usw-ex0108-061.remarq.com>
Source record: 41687

Thanks to everyone that responded,I think you all hit the
nail on the head. The problem was in the antenna. While
going to work this morning I noticed that there was no heat
on anything.It was raining out so I did'nt think much about
it at that time,later in the day when everything had dried
out the heat was back on my mic. So I checked every thing
on top of the van and sure enough the whole grounding nut
was very loose, tightened it up and the problem was gone.
So I think I'll pull it all apart this weekend and clean it
up and put new coax in line.
Thank again
Hacksaw

i've recently installed a maxon MCB-30 with a "cell phone" style CB antenna mounted to the back glass, in my '98 nissian pickup. everything works well until i start the engine then the interference becomes enough that i have to crank the squelch up to keep things quiet. this being the case, i don't hear much until somebody is close.

anyway, i'm getting interference from somewhere but it has to be one of 3 things: 1) cheap electronics (shame on me for trying to save a few bucks), 2) interference through the power, or 3) something is omitting a signal that the antenna is picking up. please feel free to correct me if you think i should add a fourth category. i would prefer to use the radio that i already have, since it's paid for, so lets concentrate on possible problems 2 and 3.

i've approached my potential power problem in the following manner. in an attempt to eliminate some variables, i've "plugged" the hot wires into various different places in my fuse box thinking the interference might be coming from a particular electrical circuit. i realize sticking wires into the fuse box isn't very professional but i thought i'd try the easy stuff first. i then wired the CB directly to the battery terminals but it didn't help. i tried a power source filter from radio shack but no good there either. the only thing i haven't done, to totally rule out the power source problem, is to wire my radio to a second battery, which isn't connected to the electrical system, then start the engine. if the problem still persists i can eliminate the power supply as the source of the problem.

i don't know how to deal with the potential "omitting of a signal". i did remove the radio from it mount, with the antenna attached, and set it outside of the truck. it had to be a good 6 to 7 feet away from the truck when i started the engine but the noise was still there. i thought moving the antenna cable and radio away from the possible source would reduce the noise but it didn't. keep in mind the actual antenna mount was still attached to the back glass when i did this. if a "omitted" signal is my problem is there anyway to overcome it?

i know maxon isn't the preferred brand of CB by many enthusiast but i would prefer some good advice beyond telling me to trash the maxon and buy something better. believe me, i've already thought about that. i'm worried that the problem might still persist even if i use a high dollar radio but, if this is a common problem with cheaper electronics, that may be the only solution.

one more quick note, i have a cobra handheld that displays the same problem when i plug the power cord into the cigarette lighter. when i unplug the power cord from the lighter, allowing the handheld to run

from it's batteries, the noise disappears. this is why i believe it's a power problem but i can't figure out how to isolate it.

i would appreciate some advice if anyone has an idea how to fix it.

thank you,
doug

Newbie Question --

Where's the best place to buy cb related equipment and accessories on-line? (best meaning product selection, price, customer service, etc.)

Thanks in advance!

Trent

I have a superstar 360FM that someone added channels.

In the process they used the anl/nb and tone switches to control them.

I have mounted switches on the back of the radio and want to restore
the NB and Tone switches.

I need to know wire locations from the pc board to the switches.

If anyone can help me with this info or has a schematic for this radio
please
let me know.

Thanks & 73's

Malo Noche, Amigos.
Our Communist led government led by chief Commie Bill Clinton gave Elion back to the Cuban Commies, and opened the door ending the 40+ year of the blockade of Cuba. And What a nice 4th of July surprise it was to totally avoid the principal of LAW that IF a parent dies trying to get one here, that that principal says that he SHOULD stay here would work in the olden days. But now Elion will have to daily deal with Jack Booted thugs where he is now, instead of the one time rip off of him from his relatives home. What does this have to do with CB? He won't be able to talk on one now, unless he gets in office after Castro. Did you skip shooters ever talk to CB in Cuba? The Commie thugs there would never let the people have their OWN radios to transmit on, except a few hambos that are probably IN the party that they have under their iron fist! All I got to say is you NY people don't vote for Hillary and whatever you do DO NOT vote for Gore or you will be Gorred for sure (or your Mobeel will be) and make sure you blow off boom booms on the 4th FOR EEEEELLLLEON ! Crying IS allowed on CB today! Cry loud because of what has happened!!!!! Can we have a Cuban in Miami give me a BIG 10-4 ?
Dave!!!!!!!!!!!!!!!!

7930. Help - Troubles with new antenna & SWR

Newsgroup: rec.radio.cb
Date: 2000-06-28 00:00:00 UTC
From: Jack the Ripper <pyro@maniacs.com>
Message-ID: <pyro-A8E702.23075628062000@enews.newsguy.com>
Source record: 41703

I just got a Radio Shack glass mount antenna the other day and am now in the stage of trying to tune it to my Cobra 18 Ultra WeatherBand CB inside my truck. The antenna comes with a 15' cable already connected to the antenna base inside (outside sticks with adhesive on the other side of the glass). My problem is this: I've only been able to tune the antenna (has a small tuning potentiometer) on channel 19 with an SWR reading of 1.4. When I switch down to channel 1, it reads over 3 in the red and 40 reads about 2.5 but not in the red. I realize there will be variation over the broadcast spectrum, but this is a bit much. Is there anything I can do to try and keep the readings from spreading so much? Thanks in advance...

PS: I haven't grounded the antenna, but I'm pretty sure it's non-grounding.

My apologies to anyone I (inadvertently) offended. But when I think about it, the reason I said those things is because in my "neck of the woods" black people are rare and most of them aren't real friendly characters. I guess I was allowing my (limited) experience with this other race interfere with an un-biased message.

Who are you? Tell ya what.. buy one of them and roll it up, bend over and shove it straight up your ass...

You're nothing to me you little puke.. you are nothing but another duck trying to get in the action... anyone who hangs out in here and KNOW'S what they are talking about will not buy those pieces of shit "Secret CB" anyway. Perhaps -I- was actually giving him a better opportunity to sell them....

7943. Re: CB TROUBLE IN A NISSAN FRONTIER

Newsgroup: rec.radio.cb
Date: 2000-06-29 00:00:00 UTC
From: Gary Danaher <gdanaher@home.com>
Message-ID: <395B5B3E.E558352E@home.com>
Source record: 41716

Start with a couple things:
1. Reconnect the wiring from the radio directly to the battery and fuse both positive and negative. Not throught the fuse block--directly to the battery.

2. Lose the micro antenna. Remember that a full wave length antenna would have to be about 34 feet long. What fraction of a wavelength is that little thing that is sticking up? Now, get a different antenna and connect it outside the truck like you did before and notice that as you go away from the vehicle, the noise tends to go away.

The problem might be the fuel pump. If you can click the starter enough to toggle the fuel pump without actually starting the engine, try to see if that generates the noise. If not, see if there is a relationship betwen frequency of the sound and the speed of the engine. If the noise is constant then it might not be related to anything specific to the ignition system. Consider pulling all fuses to disable as much equipment as possible and see if that cures the problem. If so, add them back in until the problem reappears and you will know where the noise is coming from.

If the problem appears to be ignition related, check the wiring-perhaps pull one plug wire at a time off and see if it changes. Consider replacing old spark plugs, old ignition wiring, and clean all connections to reduce resistance.

A proven fact?!?! You make me embarrassed to admit
I'm whit with people like you making these kinds of
statements.

So......by saying those
>things, does that make me racist? Would it be better if we all just forgot
>about that? Said it wasn't correct or something?

No, it would be better if you didn't assume things were facts.
You obviously know very little about the effects of society
and/or culture on individuals.
>
>For all you know, I could be black.

Not likely with a central european sounding last
name. At least someone in your family is German.

Maybe you ought to think about that before
>you say anything else........ I know in our "politically correct" society
>race, sex, and age aren't supposed to matter - but the truth is we all form
>prejudices without even thinking about it. For example - if you walked past a
>black person on the street in a big city, would you feel more frightened then
>if you walked past a white person? Of course you would.

No...I wouldn't. The race isn't nearly as much an issue as
the overt attitude displayed by the individual. If simple
skin color makes you more uncomfortable, you have some serious
unresolved race issues.

Bob

Hello

Found I needed a new meter in one of my radios and had to buy from local radio shop. Cost me 12.50.

Get most of my parts from Radio shack and through places like Copper electronics

Does anyone have a good source for getting parts like Meters and switches that would not normally be found at such places?

Please let me know

Thanks
Richard

Because it is too easy and cheap to get the regulator already built for you.
You can get these little surplus power supplies for about 5 to 10 bucks if you
are good at scrounging. I got 4 of them for $25 at the last swp meet I went to.
>

All I discribed was a darlington output stage used as a series regulator, a
well proven and efficent circuit as linear regulators go.

The waste of time would be designing and building a regulator from scratch when
you can get a better one than you can build for less than the cost of parts.
Its not a whole lot different from any other linear supply, Obviously you have
never tried it, regulation is top notch. Mine barely gets warm unless I crank
up the amp.

>
>
>
>
>

Yes exactly, A 1/4 wl of 50 ohm coax will transform 25 ohms to 100 ohms. You got the formula wrong. Try SQRT(25*100) this gives the impedance of the 1/4wl transformer you need to do the transformation. Now put the 2 100 ohm impedances in paralell at the radio. Hey 50 ohms, how bout that.

7964. Viking Messenger Question

"David P.",
There's nothing mysterious about speakers. Try a
Radio Shack 4-6" speaker in the cardboard box a 'Crock-
Pot' comes in. Works about as good as anything.
'Doc

Jack the Ripper,
What you're seeing is typical for a 'shortened' antenna
thats also handicapped by being a 'tru-the-glass' mount.
From the numbers you quoted, it sounds like the antenna is
'tuned' slightly below ch-19. That's as good as they get,
sorry 'bout that...

If used the other way around you can use
a splitter to mix two or more channels
into one line of coax. Of course the
insertion loses I mentioned in my
previous post applies.
Cheers,
John

It you are referring to a CATV splatter
there IS an in and two or more outs.
A two way split has an insertion loss of
3 DB, a 3 way has a 3 DB and 2 7 DB loss
outlets, a 4 way has 4 7 DB loss
outlets. If you are splitting 3 or more
outlets it is best to use an amplified
4 way splitter.
Cheers,
John

Technicaly speaking the longer antenna
usually gives better performance.
However the Wilson 5000 is built like a
brick s**t house and you will need at
least the same base strength for the
longer whip.

Is that 6 Dbi or 6 DBd? DBi means
nothing in the real world.
Cheers,
John

I get such parts from various wholesalers or from the manufacturers. Most of the wholesalers require that you be a business before they sell to you. Don't begrudge the local shop making a profit. That is the only way he can stay in business. I remember when there were over 50 storefront CB shops in Tampa, FL. Now there are only 5 left with only 2 that have licensed and qualified CB techs.

If you do a bit of searching on the net, you may come up with a source for the parts you need.

sure you can.....put a solid state rectifier in it and increase
the voltage to the plate of the final tube....should do about 9
watts....to boost the rcve lower the value of the screen grid
resistor on the 1st rf amp...

4 gauge to the battery, through my audio fusebox with the big gold plated finger sized fuses, and some more 4 to the box. Still grounded to the seat post and I have 0 ohms from my coax shield to the seat post ground. The coax shield is connected in the trunk to the lid and the body with some braid.

I have some pictures to scan in of the installation. If I had more time, there's a web page I'd like to build.

Those are the best for that rig! Do the mods all of them and tell me your results! I've got more good one's too! I still do need a schematic! I have that info you sent thank you but was looking for a little more! If not its ok someone out there has what I need!
Bach to those mods you will have better voltage stabilty! For a single final radio they can scream if yoiu do those mods All of them! Try it and tell me your results!

i havet a 2510 with a turner plus 2 and a nice solid state base amp. the amp has 4 2879's b biased and was made back in the 70's with the new 2879's put in about 2 years ago. its a good setup and sounds cleaner than any galaxy ive ever heard on am or ssb. no listenable distortion and i dont run it with a super low dead key. 24/7 key down time.

JO-Gunn is nothing but a bunch of garbage; go with a Maco M-103 or M-104.
TRUST ME ON THIS ONE.

I know someone who is wanting to buy one of the new Cherokee 2100 radios. I found them on a couple of sites with photos and prices...but they are not yet selling them. Does anyone know of an outlet that is actually selling these radios right now? Thanks

No I have not heard you yet Modsquad, but I will be listening. There are some mighty big rigs running around this bay area so I am sure that we talk to some of the same folks on the bowl, but there are times that I know darn good and well that I am not gonna get up over some of those multi-kilowatt stations. I have heard a few folks on this ng out there, but am always listening for more. 3s!

JEEZ HELL NO !
I live in New York and now enjoy the city again.
cant stand Hillary and her batch of degenerate east end Hollyweird creeps
trying to turn this place upside down again.
Funny she says she likes the Yankees, Cony Island, and the city.
I am here 40 years, never seen her in Yankee stadium or a hot dog stand.

I remember in the 60's Castro let all his criminals out of jail and they all
came here thank to liberals and there dam welfare.
Now considering all the people living here it the safest US city.
With the ousting of that bastard Mario Cuomo cleanup of the city was
amazing.
Guliani grabbed all the riff raff of all creed and colors, made NY a *VERY*
uncomfortable place for them.
Now we have the still married wife of a unconvicted rapist, crook, flower
child, dope smoker represent what good
for New York.
Hillary will will let out all the mentally ill homeless, future subway
pushers, 2nd time felons, welfare abusers and make
decent hardworking people suffer again.

.....Ok back to CB

Hey Sarge, there are a few licensed techs on this side of the bay (Pinellas) but I only deal with 2. Jeff House that runs Hudson Electronics up the big road a ways has a great reputation among some radio folks, and even though I never dealt with him directly, I know quite a few that have and say he is really good and fair.

Elians mother & father created him. His mother, who took him out of the country illegaly is dead...so he belongs with his father, who gave him life. In reality, Elians father is the only person who ever had the moral right to decide where his own son should live.

Now, if it had been reasonably proven that Elians father was an unfit parent for whatever reasons, barring U.S. Cubans understandable, (especialy after having made permanent homes in the United States) but none-the-less bias toward Castros Cuba that colors and taints their veiw regarding all things Cuba, including a single parent, who is gainfully employed, who loves his son enough to come to the United States and put up with this media & political driven absolute non-sense to collect him and take him back home so he can prove his ability to raise his son to the world.

The proof that the father is an unfit parent never emerged. However, that the mother would endanger her small childs life attempting such a trip, because her boyfriend pushed her into it, speaks volumes about her poor judgement. Judgement so poor she could not envision all possible hazards...and therefore lost her life. At least the father is trying to make a decent life for his son, without getting himself or elian killed in the process.

The U.S. intelligence services checked out pop...he can provide reasonable food, shelter, and medical care for his son.

Social considerations? Schooling? Looking past the word communist you will find that schools in Cuba are much better than you would think. Yes they spread dis-information...but so do schools in the United States, they just hide it better. And at least the schools in Cuba do not adhere to that hidious political correct phenomenah known as social promotion.

Elian is finally back with his father...which is where he should have been returned to immediately after his rescue and medical testing.

No experience with the Jogunn, do know many folks that swear by them, so there must be something to it. Living in an area prone to serious winds from tropical storms and the occasional hurricane, I can say that my Macos have fared the best weather wise. PDL II is a good antenna also. A good radio buddy of mine has one and he loves it. Actually, I do not think you can go wrong with any of the 3. Personally I would probably go with the Maco, but that is just because I have never had a problem with one, except for the damn beach birds and parakeets perching on it.

Source record: 41792

Hey guys, need some help here...
BEFORE I send this unit back to the seller and get my money back, I'd like to see if it's possible to fix it. I can't get power to the unit, either from a power supply or a power cord (110v), although the clock does light up and run when I hook up the 110 line.
There is a transistor (marked 0171? C945?) on the board connected to the power supply (13.8v) connector, and this transistor is obviously blown (well, cracked at the top) and the electrolytic cap. next to it was essentially missing (the pins were still soldered into it's holes, and the black rubber base was still above the board, but the leads just came up out of the rubber base and looked a little burned/bent. This is marked as C301 on the board...
Anyway, I know I could probably just replace these components and then check for damage down the line from them (another bigger power transistor looks to be in fine shape but could have suffered damage from whatever caused these other two to crap out!) but I have no reference for the parts values, and need some input. BESIDES the obvious one of sending it back to the bonehead who sold it to me (and I'm the bonehead who bought it!)... any schematics or parts lists around? Anyone have experience with this radio?
HELP!!! :-)
Linus

The Gun's are nicely built and perform well, some of his claims are exagerated but the antenna designs are proven... The bad thing are his prices, pretty high in my opinion... PDL2 is a great little antenna, super performance from something you can use a TV antenna rotor on! Wilson/Maco are also solid performers, and probably the most reasonably priced... If you have a huge budget and don't mind the $$$ get the Gun! If you want the most bang for your buck go with the Maco....

TUBES AVAILABLE

I currently have over 300,000 tubes in stock. TUBES Have a good selection of both new and used/tested tubes for audio, CB & HAM radio, TV, CRT use.
Sorry I do not have a Web Site nor a price list. Suggest that you Email or Fax me with the tubes that you are looking for along with the quantify of each needed. I will check my inventory and advise you of current availability and cost.
In addition, I also have a very good selection of tube testers, tube caddies and good used CB/HAM equipment. Please contact me regarding your needs.
Thank you for your consideration.

Thought they were. The scumbags sent me a notice alerting me of their new base station. I just figured it would be for sale since they were advertising it. Do not know how well versed you are in the Cherokee radio department. Depending on what you are going to do with the radio, chances are, if you are not famliar with the Cherokee line, you are going to learn. If you already know, come back and post your 2 cents and give a little review after you bought the radio. Maybe they worked out the bugs.

In addition, I would suggest tracing the antenna lead looking for near
by wires / wiring harnesses. I had a hell of a time routing my co-phased
away all of electrical wiring in my '92 KingCab.
Also, make sure you're not trying to use the glass-mount with (factory

or aftermarket) tinted windows, as this is a surefire no-no. You'll cut down your RX/TX distances considerably by trying to go through the tint.

Just my 2¢,

I probably will send it back (some help YOU are :-))
but it doesn't look like a strike to me... there's no evidence of burning, or arcing anywhere. Even the immediate area surrounding the bad components is clean and scorch-free.
I guess that doesn't mean it CAN'T be lightning damage but I've seen the results of direct and indirect lightning damage, and this case isn't at all similar.

Doc,
Walmart had these antennas for $9.95. Just for kicks, I bought one---
probably use it for a scanner, LOL! I put it on the car, and tested it
with a 259 Analyzer. The thing resonated up in the 10 meter band! I
found a small stinger in my parts box and cut it down until I got it
back in 11 meters. The whip is several inches longer than the one sup-
plied. I don't think much of glass mounted antennas. I had one of the
2 meter ones--wasn't worth a darn, either--as expected. Just illus-
trates the old adage: You can have "pretty", or you can have "perfor-
mance". They don't come together, and, after all, "pretty" is in the
eye of the beholder, isn't it?

Jerry

Try a 2N2222 and a 2200uf 35 volt electrolytic, but first with those parts
out, start ohming the series pass xsistor, the fullwave bridge, and the
zener is probably toast. There isn't much to a small regulated supply.

If it doesn't blow the fuse on 12V then the reverse protection diode isn't
the cause. I wouldn't waste my time unless the radio was free.

That's the likely route, after a bit of tinkering most of the afternoon.
Good thing I really didn't have anything else to do today! :-)
I'll try the N2222 and the 2200uf cap, and the method you suggested in your
previous post, thanks a bunch! (You are some help after all! :-)
Have a cool one Scott-

Macos are good and so are the gunns. Ive had both and I'm
on my second set of gunns.(wind got my tower and 4v)So I
went with a super audio 5 flat and would not have anything
else.The gunns are over priced but you can not beat the
maintenance free construction.
Let your pocket be your guide, you can't go wrong with
either beam.
Good Luck
Hacksaw....flat side Gunns..NW IL.

8083. TRC-446 mic pin outs?

Newsgroup: rec.radio.cb
Date: 2000-06-29 00:00:00 UTC
From: Coax Kid <coaxkid@NOSPAMcoaxkid.com>
Message-ID: <5o8olscdinih4ukbfk2gr9ebujefuaf1s8@4ax.com>
Source record: 41856

Anyone know the pin outs for a Realistic TRC-446? The wiring is not in
any of the books and Radio Shack was no help. I don't have the stock
mic or radio to work with. It's 6 pin, like the RCI 2950 with up/down
on the mic.
TIA
CoaxKid@coaxkid.com

I seem to remember a 5 or 10 watt ceramic resistor feeding the plate of the final tube that you jumped to get about 10 w out. If I can dig up the old schematic I will post the location, etc.

8085. Warning! Is Export R US going out of business?

Newsgroup: rec.radio.cb
Date: 2000-06-29 00:00:00 UTC
From: John Amero <" johnaNO§PAM"@island.net>
Message-ID: <395C19EF.933CE8A2@island.net>
Source record: 41858

Export R US keeps warranty radio.

They have my Galaxy 99 for warranty repair which failed in the two days that I had it. It took 6 seeks for it to come to Canada by parcel express which they insist on sending it by. This method is not traceable across the boarder.

After I sent it back for repairs Export R US _s a y_ they sent it by regular post. It is now lost!!!! And I am pissed!!!! They have had my money in CAD since December... $587.86 plus $80 Canadian customs.

To all Canadians do not deal with Export R US.... you will will just waste you money.

BTW Export R US is not answering their phone, E-mail, or phone messages.

John, sorry to hear you're having
trouble with Exports R Us. I went
through my records and found the
following info that you might want for
your records.

1. Radio was received by us on 3/8/00
2. New DX99 ser# 913827 shipped to
Exports R Us on 3/30/00
3. Our outgoing inv# 000911

I just called them and left a message
because they aren't answering
phones for some reason. Keep me posted.

John

Hello all!
We got an old Skipper 300 that had too much power pumped
into it, and it let the smoke out.
Looking to fix it or get it fixed. Any schematics out
there for this unit? Any help appreciated.

Life's Reflections

1. Never raise your hands to your kids. It leaves your groin unprotected.

2. I'm not into working out. My philosophy is no pain, no pain.

3. I'm in shape. Round is a shape.

4. I'm desperately trying to figure out why Kamikaze pilots wore helmets.

5. Do illiterate people get the full effect of alphabet soup?

6. I've always wanted to be somebody, but I should have been more specific.

7. Ever notice when you blow in a dog's face he gets mad at you, but when you take him in a car he sticks his head out the window?

8. Ever notice that anyone going slower than you is an idiot, but anyone going faster is a maniac?

9. You have to stay in shape. My mother started walking five miles a day when she was 60. She's 97 now and we have no idea where she is.

10. I have six locks on my door, all in a row. When I go out, I lock every other one. I figure no matter how long somebody stands there picking the locks, they are always locking three of them.

11. One out of every three Americans is suffering from some form of mental illness. Think of two of your best friends. If they are OK, then it must be you.

12. They show you how detergents take out bloodstains. I think if you've got a T-shirt with bloodstains all over it, maybe your laundry isn't your biggest problem.

13. Ask people why they have deer heads on their walls and they tell you it's because they're such beautiful animals. I think my wife is beautiful, but I only have photographs of her on the wall.

14. A lady came up to me on the street, pointed at my suede jacket and said, "Don't you know a cow was murdered

for that jacket?" I said, "I didn't know there were any
witnesses. Now I'll have to kill you too".

Big deal I say, The United States Government spent one million eight hundred thousand dollars on him, his family, bringing his classmates here, his school teacher, and his step mother. When was the last time the U.S.A spent that kind of money on a senior citizen because he/she could not afford to live.....or when was the last time the govt shelled out surplus money(OUR MONEY) back to us in a usefull manner.....NEVER !!!!! When my parents came here in 1956 (DURING THE REVOLUTION) in Hungary, no-one at all reached out a helping hand to help them out!!!!! NOW a days any damn foriener can come here and gets TONS AND TONS of fianancial assistance from the U.S.A.....its not fair, and in my opinion, the u.s.a has enough problems of its own, worry about them FIRST before they worry about some little god-damned little communist ! Im a very fair, open minded, and kind guy, but im sick and tired of all this god-damned garbage going on. We the citizens of the U.S.A. should ALL be god-damned millionaires, after all THIS IS THE RICHEST COUNTRY IN THE WORLD.....take care of US FIRST!!!!!!!! Best Regards to ALL AMERICANS. Frank.

Do you call that an attack? You must be a real puss bag...
You can end it all very easily call your brother get the camera
its just that easy ...As they say the balls are on your neck,whoops I mean
in
your court...

Just a short reminder that the Charlie November Summer 2000 DX Contest starts this weekend. Everyone is invited to take part, members and non-members. For full contest rules and info goto:

http://www.angelfire.com/nc2/2cn115

Click on the News and Events banner. Also, to everyone that plans on taking part, you must download the official logsheet and scoring sheet from the above web site. Both forms are in Word format.

Hope to hear everyone on the air and good luck.

Within the last few days someone posted some info about "Optimal test lengths" for different coax types. I think these are resonant lengths used by builders. The post noted various coax types and their calculated physical length. If anyone has a copy of it or knows which header it is in please e-mail me.

Thanks,

--

As to what Mr Amero has stated, he is not correct with most of his statements. I spoke to Ray at Galaxy on 6/29/2000 about his problem at approx. 6:00pm cst. We were trying to figure out a way to find Mr Amero's radio that was sent by mail per the request of Mr Amero. He had sent his radio to Galaxy with concern that the SSB was not working correctly. The Galaxy staff found nothing wrong with the radio and as a courtesy to Mr Amero, they replaced the radio. Per My Amero's discussion with Galaxy, he asked that the radio being replaced be sent to us from Galaxy so it could be expanded. This was done as requested by Mr Amero and we did what we were asked to do by Mr Amero. We have spoke to the USPS postmaster where the radio was sent from and they are trying to assist us with finding this package. Galaxy also suggested another way to mention to the postmaster that may help in the process of finging this package. This why we had made decissions not to ship USPS anymore with the exception of inside the USA. The sender does not have many protected rights outside the USA when shipping postal and the receiver doesn't either. Needless to say, we even told Ray at Galaxy that we would replace the radio for Mr Amero if it was not located using the other method that was suggested. The main reason that we would replace this radio is due to the fact that we did not use our better judgement when we shipped this package by USPS, but rather try to keep Mr Amero happy. He has all right to be upset, but he should take the proper channals as we have been doing to resolve this for him. But to answer the question, NO by no means are we going out of business are even closs to going out of business, we are growing larger and yes we are in merger negotiations with other respected businesses. We are wholesaling to cb shops and dealers with the same competable pricing structure as the million dollar companies, so no we are not going out of business Mr Amero.

We have the voice mail set up on a roll over line so that when the 3 lines that we have are busy you can leave a message like Galaxy did and they got the return call as asked. Before you make statements like these, you may want to think about why a place of business would even care to help you out. Well no matter, we have an honest business and will continue to have one. Hopefully you receive your radio soon or we will live up to our word.

Hello there,

Can somebody tell me where on the web I can find a page (or pages) on tweaking/modifying a Uniden PC122XL ? I tried searching using Infoseek but didn;t come up with anything.

Also, what are the safe limits for increasing output of this radio ?

Thanks in advance,

Richard.

You make a very good point. "America" doesn't care about "Americans." They only seem to care about any Bean that decides to jump the border. Who cares about Americans? We can cover our own asses but stupid beanz can't? What about the Americans that can't make it? In my town, Mexican imagrants outnumber Caucasian and African Americans and they take all the jobs when there are MILLIONS of natural born Americans that need the jobs more.

hey lowrider or whatever your name is today. first off, you may well
have a suburban, but my question to you is 'so what?'. you run a stock
alternator, you have not done any modifications to it, you have not
paid the price, you have not lived the nightmare of mulutiple
alternators on a daily driver. boy , you got to pay to play. and you go
around calling yourself lowrider in the long nose, man get out of town.
there are a lot of people running around using that handle and i can
tell you they would squash you like the duck that your are. talking all
that stuff about no name, then you run davemade, man get
reeeeeeeeeeeeeaaaaaaaallllllllllllllllllllllllllllllllll. don't get
the big head boy, just because somehow someway you won some little
podunk hillybilly keydown. i tell you what . bring your ass over to the
pig pen on july 4 and bring your silly ass up to the line and get some
of this.....think about it,.....cd is out....

The old adage applies yet again: "If it sounds too
good to be true, it probably is"

Seems that application of it to "ham radio" dealers and
repair shops is MUCH higher than that for ur average consumer
goods. With today's surface mount electronics it is near
impossible for hams to fix their own equipment.
Perhaps like almost all other Jap electronics
products, it's now cheaper to toss a rig into the trash
and buy a new one instead of getting the old one fixed.

Source record: 41973

I have chosen to change the mike on my
RCi 2950.
I wired a new mike to the connector from the stock mike
but of course the new mike does not have the channel changer buttons on it
so that leaves me with two unused pins.

Well now the the damn thing wont stop changing channels
by itself unless I unplug the mike.
how can I disable the chanel changer feature that works through the mike?

does this make sense?

282 Dallas Tx.

I can appreciate the passion, but please, what does your rant have to do with anything?
It's spelled "bastard", by the way, not "bastered".
And if there's no such thing as 'Cuban' Americans, then what about everyone else who is not native to this soil? Namely you, me, and about 300 million other folks?
Linus

Source record: 41984

"The paradox of our time in history is that we have taller buildings,
but shorter tempers;
wider freeways, but narrower viewpoints;
we spend more, but have less; we buy more, but enjoy it less.
We have bigger houses, but smaller families;
more conveniences, but less time;
we have more degrees, but less sense;
more knowledge, but less judgment;
more experts, but more problems;
more medicine, but less wellness.
We have multiplied our possessions, but reduced our values.
We talk too much, love too seldom, and hate too often.
We've learned how to make a living, but not a life;
we've added years to life, but not life to years.
We've been all the way to the moon and back, but have trouble crossing the
street to meet the new neighbor.
We've conquered outer space, but not inner space;
we've cleaned up the air, but polluted the soul;
we've split the atom, but not our prejudice.
We have higher incomes. But lower morals;
we've become long on quantity, but short on quality.
These are the times of tall men and short character;
steep profits and shallow relationships.
These are the times of world peace, but domestic warfare;
more leisure, but less fun;
more kinds of food, but less nutrition.
These are the days of two incomes, but more divorce;
of fancier houses, but broken homes.
It is time when there is much in the show window and nothing in
the stockroom;
a time when technology can bring this letter to you, and a time when you can
choose to make a difference..."

"Live as if you were to die tomorrow. Learn as if you were to live
forever."

Not bad, however I can't help but make one comment.
Don't take it as a put down but rather as a suggestion.

On the personal picture section of your web page the statement
under one pic said something like this: "I spend 50% of my time on the
radio and 50% of my time on the computer." This is obvious if you
look at the picture.

It would be better if you could some day post a new improved picture
and a explaination below that says: "I spend 33% of my time on the
radio, 33% of the time on the computer, and another 33% of my time
looking after my health.

What is happening is that the shield is touching one of the wires in the mic connector, Insure that this is not happening. I bought a D104MC mice for my 2950 and had the company I bought it from wire it up for the radio. When I pulled it in the radio starting scanning like crazy. After a frantic phone call to the company they let me konw what was going on.

Lemme know if this works...

That is certainly your opinion, however for the money I would choose differently..... They are, and always have been, OVERPRICED! If the fellow indeed does not care about all the toys a Washington has just as much capability for less money! unless he's getting a really good deal on the 2000 I would pass and continue shopping....

I am not planning on buying any Cherokee radio. I am checking on the unit for someone who is who does not have access to the internet.

This person has a fondness for Cherokee radios. I have no idea why...nor why those ding-a-lings at Wireless Marketing don't just release the damn thing.

Steve you know as well as I do that most of peoples radio problem is not the equipments fault, it is usually easier to do it for them than it is to trust them to do it their selves, I am not trying to say I know everything, But I do know that I can have something work perfectly and the next guy will have tons of problems, get it back and it is fine, then automatically it is the persons fault that it came from and then comes the slandering, kinda chicken shit to me. Just my 2 cents.

I am in the process of building a large variable voltage regulated power
supply but am having a hell of time finding a transformer.

8182. Swap 2510 for H card

Newsgroup: rec.radio.cb
Date: 2000-06-30 00:00:00 UTC
From: Duffer <hduff@ica.net>
Message-ID: <395D1DFF.DB63CE27@ica.net>
Source record: 42005

Have a Uniden HR-2510 allmode rig. Covers 26 to 29.7 MHz.
Condition good...about 8.5 to 9 out of 10.
With mic and bracket.
Will swap for a valid DSS "H" card.

Please e-mail if interested.

8183. Re: Race issues?

Jeff,

First of all, I appreciate the nice email you sent to my ISP. Second, I appreciate the fact that you threatened to DOS me right here in front of the newsgroup and the world. I'm sure my ISP will really like that. They really like people that threaten to DOS their users! Also, you called me a "cracker," which is an openly racist comment. You do both of these things, then you dare to email my ISP! WOW!

As far as the hate crime, I don't think using the "n" word constitutes a hate crime, and certainly I should not be arrested like you said.

I will, however, ease my "hatred" as you put it in your complaint. I just hope that I don't get arrested for the "hate law" that you speak of. Sounds really scary. I wonder what the punishment is?!?

By the way, I just can't resist correcting your spelling in the complaint, "I am positive that a company of your statue will handle..." I think you meant "a company of your STATURE," noting the R in there.

Have a good day,

Patrick

PS..

After looking at the @Home terms of service, it says you cannot attempt to hide your identity while on usenet. Since you are using mailto:president@whitehouse.gov it looks like you are attempting to do just that. I think I'll email them and let them know. Also, the threat to DOS me will be forwarded too.

You are in violation of the following, as per the TOS page located at http://www.home.com/support/aup/

1. Any fraudulent activities, including impersonating any person or entity or forging anyone else's digital or manual signature.

2. You may not disrupt the Services. The Services also may not be used to interfere with computer networking or telecommunications services to any user, host or network, including, without limitation, denial of service attacks, flooding of a network, overloading a service, improper seizing and abuse of operator privileges and attempts to "crash" a host.

If you were to buy something for base use, I'd spend my money on a mobile export. More bang for the buck. Most with the 6900 chassis have far superior rx'ers to the 2000, and power output is double. Ones such as Ranger 6900, 2960F, 148GTL-DX+

Actually Ralph we started off as a small dealer as you would say, but had the ambition to go further. I started this business myself from a small building next to my home and now its spawned into 3 other businesses that do very well. I did not keep a real job like most. I went into it full time and I'm still in it full time. With projected sales this year being right on schedule, they should double again this year. Like I said, it was my ambition that has soared these companies ahead with the same service that as you said the small dealer has.

Needless to say, we are and still will be here. Oh those Davemade copies as
you said will still be here as well. The X Force units are not going anywhere
since they for some reason seem to do better than the ones that they were
copied after. With X Force sales contributing to about 32 to 37 units a week
sold, I'll continue to run my X Force products just like everybody else.

Hi all,

I am getting back into this after losing interest in the mid 70's. I have recently gotten an Emperor model TS-3010.

Anyone have comments, good or bad would be helpful. The radio was modified by the guy I got it from for power and a few extra channels.
I have already been to Cody's PC site...

Hi Fred,
You know those pictures of me were taken in Oct 1999. Since then I have
been 'looking after my health' and have been following a weight loss plan that
is been prescribed by my primary care physician. I have come down from 313lbs
to 270 and am going for more.
I hope this meets with your approval.

Tnx for reply,
I'm using with an A99 on top of an apartment roof, it's a new radio of which Ive heard that some came out with this intermmittent problem. Other radios like the 2950 work okay from here. Im not using any amp or pwr mics. Any advice is appreciated.
Thanks
